

**FEATURES**

- 8-channel, 24-bit simultaneous sampling analog-to-digital converter (ADC)**
- Single-ended or true differential inputs**
- Programmable gain amplifier (PGA) per channel (gains of 1, 2, 4, and 8)**
- Low dc input current**
  - ±1.5 nA (differential)**
  - ±4 nA (single-ended)**
- Up to 16 kSPS output data rate (ODR) per channel**
- Programmable ODRs and bandwidth**
- Sample rate converter (SRC) for coherent sampling**
  - Sampling rate resolution up to 15.2 μSPS**
- Low latency sinc3 filter path**
- Adjustable phase synchronization**
- Internal 2.5 V reference**
- Two power modes optimizing power dissipation and performance: high resolution mode and low power mode**
- Low resolution successive approximation (SAR) ADC for system and chip diagnostics**
- Power supply**
  - Bipolar (±1.65 V) or unipolar (3.3 V) supplies**
  - Digital input/output (I/O) supply: 1.8 V to 3.6 V**
  - Performance temperature range: –40°C to +105°C**
  - Functional temperature range: –40°C to +125°C**
- Performance**
  - Combined ac and dc performance**
  - 108 dB signal-to-noise ratio (SNR)/dynamic range at 16 kSPS in high resolution mode**
  - 109 dB total harmonic distortion (THD)**
  - ±7 ppm integral nonlinearity (INL)**
  - ±40 μV offset error**
  - ±0.1% gain error**
  - ±10 ppm/°C typical temperature coefficient**

**APPLICATIONS**

- Circuit breakers**
- General-purpose data acquisition**
- Electroencephalography (EEG)**
- Industrial process control**

**GENERAL DESCRIPTION**

The AD7779 is an 8-channel, simultaneous sampling ADC. There are eight full  $\Sigma$ - $\Delta$  ADCs on chip. The AD7779 provides an ultralow input current to allow direct sensor connection. Each input channel has a programmable gain stage allowing gains of 1, 2, 4, and 8 to map lower amplitude sensor outputs into the full-scale ADC input range, maximizing the dynamic range of

the signal chain. The AD7779 accepts  $V_{REF}$  from 1 V up to 3.6 V. The analog inputs accept unipolar (0 V to  $V_{REF}/GAIN$ ) or true bipolar ( $\pm V_{REF}/GAIN/2$  V) analog input signals with 3.3 V or  $\pm 1.65$  V analog supply voltages. The analog inputs can be configured to accept true differential, pseudo differential, or single-ended signals to match different sensor output configurations.

Each channel contains an ADC modulator and a sinc3, low latency digital filter. An SRC is provided to allow fine resolution control over the AD7779 ODR. This control can be used in applications where the ODR resolution is required to maintain coherency with 0.01 Hz changes in the line frequency. The SRC is programmable through the serial port interface (SPI). The AD7779 implements two different interfaces: a data output interface and SPI control interface. The ADC data output interface is dedicated to transmitting the ADC conversion results from the AD7779 to the processor. The SPI interface is used to write to and read from the AD7779 configuration registers and for the control and reading of data from the SAR ADC. The SPI interface can also be configured to output the  $\Sigma$ - $\Delta$  conversion data.

The AD7779 includes a 12-bit SAR ADC. This ADC can be used for AD7779 diagnostics without having to decommission one of the  $\Sigma$ - $\Delta$  ADC channels dedicated to system measurement functions. With the use of an external multiplexer, which can be controlled through the three general-purpose inputs/outputs pins (GPIOs), and signal conditioning, the SAR ADC can be used to validate the  $\Sigma$ - $\Delta$  ADC measurements in applications where functional safety is required. In addition, the AD7779 SAR ADC includes an internal multiplexer to sense internal nodes.

The AD7779 contains a 2.5 V reference and reference buffer. The reference has a typical temperature coefficient of 10 ppm/°C.

The AD7779 offers two modes of operation: high resolution mode and low power mode. High resolution mode provides a higher dynamic range while consuming 10.75 mW per channel; low power mode consumes just 3.37 mW per channel at a reduced dynamic range specification.

The specified operating temperature range is –40°C to +105°C, although the device is operational up to +125°C.

Note that throughout this data sheet, certain terms are used to refer to either the multifunction pins or a range of pins. The multifunction pins, such as DCLK0/SDO, are referred to either by the entire pin name or by a single function of the pin, for example, DCLK0, when only that function is relevant. In the case of ranges of pins, AVSSx refers to the following pins: AVSS1A, AVSS1B, AVSS2A, AVSS2B, AVSS3, and AVSS4.

High Resolution Mode	16 kSPS		86	133	mW
Low Power Mode	4 kSPS		27	44	mW
Power-Down	All ADCs disabled		530		$\mu$ W

<sup>1</sup> AVSSx is used to refer to the following pins: AVSS1A, AVSS1B, AVSS2B, and AVSS2A. This term is used throughout the data sheet.

<sup>2</sup> At temperatures higher than 105°C, the device can be operated normally, though slight degradation on the maximum/minimum specifications is expected because these specifications are only guaranteed up to 105°C. See the Typical Performance Characteristics section for plots showing the typical performance of the device at high temperatures.

<sup>3</sup> The SDO pin and the DOUTx pin are configured in the default mode of strength.

<sup>4</sup> AVDD1x = 3.3 V, AVSSx = GND = ground, IOVDD = 1.8 V, CMOS clock.

<sup>5</sup> Disabling either the VCM pin or the internal reference results in a 40  $\mu$ A typical current consumption reduction.

<sup>6</sup> Power dissipation is calculated using the maximum supply voltage, 3.6 V.

**DOUTx TIMING CHARACTERISTICS**

AVDD1x/AVSSx =  $\pm 1.65$  V, 3.3 V/AGND, AVDD2 – AVSSx = 2.2 V to 3.6 V; IOVDD = 1.8 V to 3.6 V; DGND = 0 V, REFx+/REFx– = 2.5 V (internal/external), MCLK = 8192 kHz; all specifications at  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.

**Table 2.**

Parameter	Description <sup>1</sup>	Test Conditions/Comments	Min	Typ	Max	Unit
t <sub>1</sub>	MCLK frequency	50:50	0.655		8.192	MHz
t <sub>2</sub>	MCLK low time		60			ns
t <sub>3</sub>	MCLK high time		60			ns
t <sub>4</sub>	DCLKx high time	MCLK/2	121			ns

## SYNCHRONIZATION PINS AND RESET TIMING CHARACTERISTICS

AVDD1x/AVSSx =  $\pm 1.65$  V, 3.3 V/AGND, AVDD2 – AVSSx = 2.2 V to 3.6 V; IOVDD = 1.8 V to 3.6 V; DGND = 0 V, REFx+/REFx– = 2.5 V (internal/external), MCLK = 8192 kHz; all specifications at  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.

Table 4.

Parameter	Description <sup>1</sup>	Test Conditions/Comments	Min	Typ	Max	Unit
$t_{26}$	$\overline{START}$ setup time		10			ns
$t_{27}$	$\overline{START}$ hold time		MCLK			ns
$t_{28}$	MCLK falling edge to $\overline{SYNC\_OUT}$ falling edge		MCLK			ns
$t_{29}$	$\overline{SYNC\_IN}$ setup time		10			ns
$t_{30}$	$\overline{SYNC\_IN}$ hold time		MCLK			ns
$t_{INIT\_SYNC\_IN}$	$\overline{SYNC\_IN}$ rising edge to first $\overline{DRDY}$	16 kSPS, HR mode	145			$\mu$ s
$t_{INIT\_RESET}$	$\overline{RESET}$ rising edge to first $\overline{DRDY}$	16 kSPS, HR mode	225			$\mu$ s
$t_{31}$	$\overline{RESET}$ hold time		$2 \times \text{MCLK}$			ns
$t_{POWER\_UP}$	Start time	$t_{POWER\_UP}$ is not shown in Figure 4		2		ms

<sup>1</sup> All input signals are specified with  $t_R = t_F = 1$  ns/V (10% to 90% of IOVDD) and timed from a voltage level of  $(V_{IL} + V_{IH})/2$ .

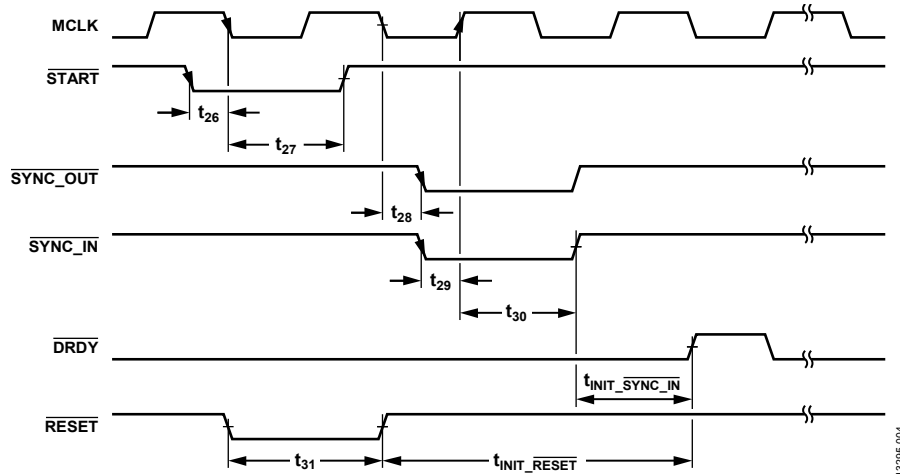

Figure 4. Synchronization Pins and Reset Control Interface Timing Diagram

## SAR ADC TIMING CHARACTERISTICS

AVDD1X/AVSSX =  $\pm 1.65$  V, 3.3 V/AGND, AVDD2 – AVSSX = 2.2 V to 3.6 V; IOVDD = 1.8 V to 3.6 V; DGND = 0 V, REF<sub>X+</sub>/REF<sub>X–</sub> = 2.5 V (internal/external), MCLK = 8192 kHz; all specifications at T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted.

Table 5.

Parameter	Description <sup>1</sup>	Min	Typ	Max	Unit
t <sub>32</sub>	Conversion time	1		3.4	μs
t <sub>33</sub>	Acquisition time <sup>2</sup>	500			ns
t <sub>34</sub>	Delay time	50			ns
t <sub>35</sub>	Throughput data			256	kSPS

<sup>1</sup> All input signals are specified with t<sub>R</sub> = t<sub>F</sub> = 1 ns/V (10% to 90% of IOVDD) and timed from a voltage level of (V<sub>IL</sub> + V<sub>IH</sub>)/2.

<sup>2</sup> Direct mode enabled. If deglitch mode is enabled, add 1.5/MCLK.

Figure 5. SAR ADC Timing Diagram

## GPIO SRC UPDATE TIMING CHARACTERISTICS

AVDD1X/AVSSX =  $\pm 1.65$  V, 3.3 V/AGND, AVDD2 – AVSSX = 2.2 V to 3.6 V; IOVDD = 1.8 V to 3.6 V; DGND = 0 V, REF<sub>X+</sub>/REF<sub>X–</sub> = 2.5 V (internal/external), MCLK = 8192 kHz; all specifications T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted.

Table 6.

Parameter	Description <sup>1</sup>	Min	Typ	Max	Unit
t <sub>36</sub>	GPIO2 setup time	10			ns
t <sub>37</sub>	GPIO2 hold time—high resolution mode	MCLK			ns
t <sub>37</sub>	GPIO2 hold time—low power mode	2 × MCLK			
t <sub>38</sub>	MCLK rising edge to GPIO1 rising edge time	20			ns
t <sub>39</sub>	GPIO0 setup time	5			ns
t <sub>40</sub>	GPIO0 hold time	MCLK			ns

<sup>1</sup> All input signals are specified with t<sub>R</sub> = t<sub>F</sub> = 1 ns/V (10% to 90% of IOVDD) and timed from a voltage level of (V<sub>IL</sub> + V<sub>IH</sub>)/2.

Figure 6. GPIOs for SRC Update Timing Diagram

## ABSOLUTE MAXIMUM RATINGS

Table 7.

Parameter	Rating
Any Supply Pin to AVSSx	−0.3 V to +3.96 V
AVSSx to DGND	−1.98 V to +0.3 V
AREGxCAP to AVSSx	−0.3 V to +1.98 V
DREGCAP to DGND	−0.3 V to +1.98 V
IOVDD to DGND	−0.3 V to +3.96 V
IOVDD to AVSSx	−0.3 V to +5.94 V
AVDD4 to AVSSx	AVDD1x − 0.3 V to 3.96 V
Analog Input Voltage	AVSSx − 0.3 V to AVDD1x + 0.3 V or 3.96 V (whichever is less)
REFx± Input Voltage	AVSSx − 0.3 V to AVDD1x + 0.3 V or 3.96 V (whichever is less)
AUXAIN±	AVSSx − 0.3 V to AVDD4 + 0.3 V or 3.96 V (whichever is less)
Digital Input Voltage to DGND	DGND − 0.3 V to IOVDD + 0.3 V or 3.96 V (whichever is less)
Digital Output Voltage to DGND	DGND − 0.3 V to IOVDD + 0.3 V or 3.96 V (whichever is less)
XTAL1 to DGND	DGND − 0.3 V to DREGCAP + 0.3 V or 1.98 V (whichever is less)
AINx±, AUXAIN±, and Digital Input Current	±10 mA
Operating Temperature Range	−40°C to +125°C
Junction Temperature, T <sub>J</sub> Maximum	150°C
Storage Temperature Range	−65°C to +150°C
Reflow Soldering	260°C
ESD	2 kV
Field Induced Charged Device Model (FICDM)	500 V

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operating environment. Close attention to PCB thermal design is required.

Table 8. Thermal Resistance

Package Type <sup>1</sup>	θ <sub>JA</sub>	θ <sub>JB</sub>	Ψ <sub>JT</sub>	Ψ <sub>JB</sub>	Unit
64-Lead LFCSP					
No Thermal Vias <sup>1</sup>	30.43	N/A <sup>2</sup>	0.13	6.59	°C/W
49 Thermal Vias <sup>1</sup>	22.62	3.17	0.09	3.19	°C/W

<sup>1</sup> Thermal impedance simulated values are based on a JEDEC 2S2P thermal test board. See JEDEC JESD51.

<sup>2</sup> N/A means not applicable.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES  
1. EXPOSED PAD. CONNECT THE EXPOSED PAD TO AVSSx.

Figure 7. Pin Configuration

13295-007

Table 9. Pin Function Descriptions

Pin No.	Mnemonic	Type	Direction	Description
1	AIN0-	Analog input	Input	Analog Input Channel 0, Negative.
2	AIN0+	Analog input	Input	Analog Input Channel 0, Positive.
3	AIN1-	Analog input	Input	Analog Input Channel 1, Negative.
4	AIN1+	Analog input	Input	Analog Input Channel 1, Positive.
5	AVSS1A	Supply	Supply	Negative Front-End Analog Supply for Channel 0 to Channel 3, Typical at $-1.65\text{ V}$ (Dual Supply) and AGND (Single Supply). Connect all the AVSSx pins to the same potential.
6	AVDD1A	Supply	Supply	Positive Front-End Analog Supply for Channel 0 to Channel 3, Typical at AVSSx + $3.3\text{ V}$ . Connect this pin to AVDD1B.
7	REF1-	Reference	Input	Negative Reference Input 1 for Channel 0 to Channel 3, Typical at AVSSx. Connect all the REFx- pins to the same potential.
8	REF1+	Reference	Input	Positive Reference Input 1 for Channel 0 to Channel 3, Typical at REF1- + $2.5\text{ V}$ .
9	AIN2-	Analog input	Input	Analog Input Channel 2, Negative.
10	AIN2+	Analog input	Input	Analog Input Channel 2, Positive.
11	AIN3-	Analog input	Input	Analog Input Channel 3, Negative.
12	AIN3+	Analog input	Input	Analog Input Channel 3, Positive.
13	MODE0/GPIO0	Digital I/O	I/O	Mode 0 Input Pin in Pin Control Mode (MODE0). See Table 18 for more details. Configurable General-Purpose Input/Output 0 in SPI Control Mode (GPIO0). If not in use, connect this pin to DGND or IOVDD.
14	MODE1/GPIO1	Digital I/O	I/O	Mode 1 Input Pin in Pin Control Mode (MODE1). See Table 18 for more details. Configurable General-Purpose Input/Output 1 in SPI Control Mode (GPIO1). If not in use, connect this pin to DGND or IOVDD.
15	MODE2/GPIO2	Digital I/O	I/O	Mode 2 Input Pin in Pin Control Mode (MODE2). See Table 18 for more details. Configurable General-Purpose Input/Output 2 in SPI Control Mode (GPIO2). If not in use, connect this pin to DGND or IOVDD.
16	MODE3/ALERT	Digital I/O	I/O	Mode 3 Input Pin in Pin Control Mode (MODE3). See Table 18 for more details. Alert Output Pin in SPI Control Mode (ALERT).

Pin No.	Mnemonic	Type	Direction	Description
17	CONVST_SAR	Digital input	Input	$\Sigma$ - $\Delta$ Output Interface Selection Pin in Pin Control Mode. See Table 17 for more details. This pin also functions as the start for the SAR conversion in SPI control mode.
18	ALERT/ $\overline{\text{CS}}$	Digital input	Input	Alert Output Pin in Pin Control Mode (ALERT). Chip Select Pin in SPI Control Mode ( $\overline{\text{CS}}$ ).
19	DCLK2/SCLK	Digital input	Input	DCLK Frequency Selection Pin 2 in Pin Control Mode (DCLK2). See Table 19 for more details. SPI Clock in SPI Control Mode (SCLK).
20	DCLK1/SDI	Digital input	Input	DCLK Frequency Selection Pin 1 in Pin Control Mode (DCLK1). See Table 19 for more details. SPI Data Input in SPI Control Mode (SDI). Connect this pin to DGND if the device is configured in pin control mode with the SPI as the data output interface.
21	DCLK0/SDO	Digital output	Output	DCLK Frequency Selection Pin 0 in Pin Control Mode (DCLK0). See Table 19 for more details. SPI Data Output in SPI Control Mode (SDO).
22	DGND	Supply	Supply	Digital Ground.
23	DREGCAP	Supply	Output	Digital LDO Output. Decouple this pin to DGND with a 1 $\mu\text{F}$ capacitor.
24	IOVDD	Supply	Supply	Digital Levels Input/Output and Digital LDO (DLDO) Supply from 1.8 V to 3.6 V. IOVDD must not be lower than DREGCAP.
25	DOUT3	Digital output	I/O	Data Output Pin 3. If the device is configured in daisy-chain mode, this pin acts as an input pin. See the Daisy-Chain Mode section for more details.
26	DOUT2	Digital output	I/O	Data Output Pin 2. If the device is configured in daisy-chain mode, this pin acts as an input pin. See the Daisy-Chain Mode section for more details.
27	DOUT1	Digital output	Output	Data Output Pin 1.
28	DOUT0	Digital output	Output	Data Output Pin 0.
29	DCLK	Digital output	Output	Data Output Clock.
30	$\overline{\text{DRDY}}$	Digital output	Output	Data Output Ready Pin.
31	XTAL1	Clock	Input	Crystal 1 Input Connection. If CMOS is used as a clock source, tie this pin to DGND. See Table 16 for more details.
32	XTAL2/MCLK	Clock	Input	Crystal 2 Input Connection (XTAL2). See Table 16 for more details. CMOS Clock (MCLK). See Table 16 for more details.
33	$\overline{\text{START}}$	Digital input	Input	Synchronization Pulse. This pin is used to synchronize internally an external $\overline{\text{START}}$ asynchronous pulse with MCLK. The synchronize signal is shift out by the SYNC_OUT pin. If not in use, tie this pin to IOVDD. See the Phase Adjustment section and the Digital Reset and Synchronization Pins section for more details.
34	$\overline{\text{SYNC\_OUT}}$	Digital output	Input	Synchronization Signal. This pin generates a synchronous pulse generated and driven by hardware (via the START pin) or by software (GENERAL_USER_CONFIG_2, Bit 0). If this pin is in use, it must be wired to the SYNC_IN pin. See the Phase Adjustment and the Digital Reset and Synchronization Pins section for more details.
35	$\overline{\text{SYNC\_IN}}$	Digital input	Input	Reset for the Internal Digital Block and Synchronize for Multiple Devices. See the Digital Reset and Synchronization Pins section for more details.
36	$\overline{\text{RESET}}$	Digital input	Input	Asynchronous Reset Pin. This pin resets all registers to their default value. It is recommended to generate a pulse on this pin after the device is powered up because a slow slew rate in the supplies may generate an incorrect initialization in the digital block.
37	AIN7+	Analog input	Input	Analog Input Channel 7, Positive.
38	AIN7–	Analog input	Input	Analog Input Channel 7, Negative.
39	AIN6+	Analog input	Input	Analog Input Channel 6, Positive.
40	AIN6–	Analog input	Input	Analog Input Channel 6, Negative.
41	REF2+	Reference	Input	Positive Reference Input 2 for Channel 4 to Channel 7, Typical at REF2– + 2.5 V.
42	REF2–	Reference	Input	Negative Reference Input 2 for Channel 4 to Channel 7, Typical at AVSSx. Connect all the REFx– pins to the same potential.
43	AVDD1B	Supply	Supply	Positive Front-End Analog Supply for Channel 4 to Channel 7. Connect this pin to AVDD1A.
44	AVSS1B	Supply	Supply	Negative Front-End Analog Supply for Channel 4 to Channel 7, Typical at –1.65 V (Dual Supply) or AGND (Single Supply). Connect all the AVSSx pins together.

Pin No.	Mnemonic	Type	Direction	Description
45	AIN5+	Analog input	Input	Analog Input Channel 5, Positive.
46	AIN5–	Analog input	Input	Analog Input Channel 5, Negative.
47	AIN4+	Analog input	Input	Analog Input Channel 4, Positive.
48	AIN4–	Analog input	Input	Analog Input Channel 4, Negative.
49	REF_OUT	Reference	Output	2.5 V Reference Output. Connect a 100 nF capacitor on this pin if using the internal reference.
50	AVSS2B	Supply	Supply	Negative Analog Supply. Connect all the AVSSx pins together.
51	AREG2CAP	Supply	Output	Analog LDO Output 2. Decouple this pin to AVSS2B with a 1 $\mu$ F capacitor.
52	AVDD2B	Supply	Supply	Positive Analog Supply. Connect this pin to AVDD2A.
53	AVSS3	Supply	Supply	Negative Analog Ground. Connect all the AVSSx pins together.
54	FORMAT1	Digital input	Input	Output Data Frame 1. See Table 17 for more details.
55	FORMAT0	Digital input	Input	Output Data Frame 0. See Table 17 for more details.
56	CLK_SEL	Digital input	Input	Select Clock Source. See Table 16 for more details.
57	VCM	Analog output	Output	Common-Mode Voltage Output, Typical at $(AVDD1 + AVSSx)/2$ .
58	AVDD2A	Supply	Input	Analog Supply from 2.2 V to 3.6 V. AVSS2x must not be lower than AREGxCAP. Connect this pin to AVDD2B.
59	AREG1CAP	Supply	Output	Analog LDO Output 1. Decouple this pin to AVSS with a 1 $\mu$ F capacitor.
60	AVSS2A	Supply	Input	Negative Analog supply. Connect all the AVSSx pins together.
61	AVSS4	Supply	Supply	Negative SAR Analog Supply and Reference. Connect all AVSSx pins together.
62	AVDD4	Supply	Supply	Positive SAR Analog Supply and Reference Source.
63	AUXAIN+	Analog input	Input	Positive SAR Analog Input Channel.
64	AUXAIN–	Analog input	Input	Negative SAR Analog Input Channel.
	EPAD	Supply	Input	Exposed Pad. Connect the exposed pad to AVSSx.

## TERMINOLOGY

### Common-Mode Rejection Ratio (CMRR)

CMRR is the ratio of the power in the ADC output at full-scale frequency,  $f$ , to the power of a 100 mV p-p sine wave applied to the common-mode voltage of  $V_{IN+}$  and  $V_{IN-}$  at frequency,  $f_s$ .

$$CMRR \text{ (dB)} = 10 \log(Pf/Pf_s)$$

where:

$Pf$  is the power at frequency,  $f$ , in the ADC output.

$Pf_s$  is the power at frequency,  $f_s$ , in the ADC output.

### Differential Nonlinearity (DNL) Error

In an ideal ADC, code transitions are 1 LSB apart. Differential nonlinearity is the maximum deviation from this ideal value. DNL error is often specified in terms of resolution for which no missing codes are guaranteed.

### Integral Nonlinearity (INL) Error

Integral nonlinearity error refers to the deviation of each individual code from a line drawn from negative full scale through positive full scale. The point used as negative full scale occurs  $\frac{1}{2}$  LSB before the first code transition. Positive full scale is a level  $1\frac{1}{2}$  LSB beyond the last code transition. The deviation is measured from the middle of each code to the true straight line.

### Dynamic Range

Dynamic range is the ratio of the rms value of the full-scale input signal to the rms noise measured for an input. The value for dynamic range is expressed in decibels.

### Channel to Channel Isolation

Channel to channel isolation is a measure of the level of crosstalk between channels. It is measured by applying a full-scale frequency sweep sine wave signal to all seven nonselected input channels and determining how much that signal is attenuated in the selected channel. The figure is given for worst case scenarios across all eight channels of the [AD7779](#).

### Intermodulation Distortion

With inputs consisting of sine waves at two frequencies,  $f_a$  and  $f_b$ , any active device with nonlinearities creates distortion products at sum and difference frequencies of  $m f_a$  and  $n f_b$ , where  $m, n = 0, 1, 2, 3$ , and so on. Intermodulation distortion terms are those for which neither  $m$  nor  $n$  are equal to 0. For example, the second-order terms include  $(f_a + f_b)$  and  $(f_a - f_b)$ , and the third-order terms include  $(2f_a + f_b)$ ,  $(2f_a - f_b)$ ,  $(f_a + 2f_b)$ , and  $(f_a - 2f_b)$ . The [AD7779](#) is tested using the CCIF standard, where two input frequencies near the top end of the input bandwidth are used. In this case, the second-order terms are usually distanced in frequency from the original sine waves, and the third-order terms are usually at a frequency close to the input frequencies. As a result, the second- and third-order terms are specified separately. The calculation of the intermodulation distortion is per the THD specification, where it is the ratio of the rms sum of the individual distortion products to the rms amplitude of the sum of the fundamentals, expressed in decibels.

### Gain Error

The first transition (from 100 ... 000 to 100 ... 001) occurs at a level  $\frac{1}{2}$  LSB above nominal negative full scale ( $-2.49999$  V for the  $\pm 2.5$  V range). The last transition (from 011 ... 110 to 011 ... 111) occurs for an analog voltage  $1\frac{1}{2}$  LSB below the nominal full scale ( $2.49999$  V for the  $\pm 2.5$  V range). The gain error is the deviation of the difference between the actual level of the last transition and the actual level of the first transition from the difference between the ideal levels.

### Gain Error Drift

Gain error drift is the ratio of the gain error change due to a temperature change of  $1^\circ\text{C}$  and the full-scale range ( $2^N$ ). It is expressed in parts per million.

### Least Significant Bit (LSB)

The least significant bit, or LSB, is the smallest increment that can be represented by a converter. For a fully differential input ADC with  $N$  bits of resolution, the LSB expressed in volts is

$$LSB \text{ (V)} = \frac{2 \times V_{REF}}{2^N}$$

The LSB referred to the input is

$$LSB \text{ (V}_{IN}) = \frac{2 \times V_{REF}}{2^N \times PGA_{GAIN}}$$

### Power Supply Rejection Ratio (PSRR)

Variations in power supply affect the full-scale transition but not the linearity of the converter. PSRR is the maximum change in the full-scale transition point due to a change in the power supply voltage from the nominal value.

### Signal-to-Noise Ratio (SNR)

SNR is the ratio of the rms value of the actual input signal to the rms sum of all other spectral components below the Nyquist frequency, excluding harmonics and dc. The value for SNR is expressed in decibels.

### Signal-to-(Noise + Distortion) Ratio (SINAD)

SINAD is the ratio of the rms value of the actual input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

### Spurious-Free Dynamic Range (SFDR)

SFDR is the difference, in decibels, between the rms amplitude of the input signal and the peak spurious signal (including harmonics).

### Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first five harmonic components to the rms value of a full-scale input signal and is expressed in decibels.

**Offset Error**

Offset error is the difference between the ideal midscale input voltage (0 V) and the actual voltage producing the midscale output code.

**Offset Error Drift**

Offset error drift is the ratio of the offset error change due to a temperature change of 1°C and the full-scale code range ( $2^N$ ). It is expressed in  $\mu\text{V}/^\circ\text{C}$ .

## RMS NOISE AND RESOLUTION

Table 10 through Table 12 show the dynamic range (DR), rms noise (RTI), effective number of bits (ENOB), and effective resolution (ER) of the AD7779 for various output data rates and gain settings. The numbers are for the bipolar input range with an external 2.5 V reference. These numbers are typical and are generated with a differential input voltage of 0 V when the ADC is continuously converting on a single channel.

It is important to note that the effective resolution is calculated using the rms noise; 16,384 consecutive samples were used to calculate the rms noise.

$$\text{Effective Resolution} = \log_2(\text{Input Range}/\text{RMS Noise})$$

$$\text{ENOB} = (\text{DR} - 1.78)/6$$

## HIGH RESOLUTION MODE

## THEORY OF OPERATION

The AD7779 is an 8-channel, simultaneously sampling, low noise, 24-bit  $\Sigma$ - $\Delta$  ADC with integrated digital filtering per channel and SRC.

The AD7779 offers two operation modes: high resolution mode, which offers up to 16 kSPS, and low power mode, which offers up to 8 kSPS. In low power mode, the specifications are guaranteed up to 4 kSPS, with performance degradation expected at ODRs higher than 4 kSPS.

The AD7779 employs a  $\Sigma$ - $\Delta$  conversion technique to convert the analog input signal into an equivalent digital word. The overview of the  $\Sigma$ - $\Delta$  technique is that the modulator samples the input waveform and outputs an equivalent digital word at the input clock frequency,  $f_{CLKIN}$ .

Due to the high oversampling rate, this technique spreads the quantization noise from 0 to  $f_{CLKIN}/2$  (in the case of the AD7779,  $f_{CLKIN}$  relates to the external clock); therefore, the noise energy contained in the band of interest is reduced (see Figure 82). To further reduce the quantization noise, a high order modulator is employed to shape the noise spectrum so that most of the noise energy is shifted out of the band of interest (see Figure 83). The digital filter that follows the modulator removes the large out of band quantization noise (see Figure 84).

For more information on basic and advanced concepts of  $\Sigma$ - $\Delta$  ADCs, see the MT-022 and MT-023.

Digital filtering has certain advantages over analog filtering. Because digital filtering occurs after the analog-to-digital conversion process, it can remove noise injected during the conversion. Analog filtering cannot remove noise injected during conversion.

Figure 82.  $\Sigma$ - $\Delta$  ADC Operation, Reduction of Noise Energy Contained in the Band of Interest (Linear Scale X-Axis)

Figure 83.  $\Sigma$ - $\Delta$  ADC Operation, Majority of Noise Energy Shifted Out of the Band of Interest (Linear Scale X-Axis)

Figure 84.  $\Sigma$ - $\Delta$  ADC Operation, Removal of Noise Energy from the Band of Interest (Linear Scale X-Axis)

The  $\Sigma$ - $\Delta$  ADC starts the conversions of the input signal after the supplies generated by the internal LDOs become stable. An external signal is not required to generate the conversions.

### ANALOG INPUTS

The AD7779 can be operated in bipolar or unipolar modes and accepts true differential, pseudo differential, and single-ended input signals, as shown in Figure 85 through Figure 88.

Table 14 summarizes the maximum differential input signal and dynamic range for the different input modes.

Table 14. Input Signal Modes

Input Signal Mode	PGA Gain	Maximum Differential Signal	Maximum Peak-to-Peak Signal
True differential	All gains	$\pm(V_{REF}/PGA_{GAIN})$	$2 \times V_{REF}/PGA_{GAIN}$
Pseudo differential	All gains	$\pm(V_{REF}/PGA_{GAIN})$	$2 \times V_{REF}/PGA_{GAIN}$
Single-ended	All gains	$V_{REF}/PGA_{GAIN}$	$V_{REF}/PGA_{GAIN}$

Figure 85.  $\Sigma$ - $\Delta$  ADC Input Signal Configuration, True DifferentialFigure 86.  $\Sigma$ - $\Delta$  ADC Input Signal Configuration, Pseudo DifferentialFigure 87.  $\Sigma$ - $\Delta$  ADC Input Signal Configuration, Single-Ended BipolarFigure 88.  $\Sigma$ - $\Delta$  ADC Input Signal Configuration, Single-Ended Unipolar

The input signal common mode is not limited, but keep the absolute input signal voltage on any  $AINx\pm$  pin between  $AVSSx + 100\text{ mV}$  and  $AVDD1x - 100\text{ mV}$ ; otherwise, the input signal linearity degrades and, if the signal voltage exceeds the absolute maximum signal rating, damages the device.

Figure 89 shows the maximum and minimum voltage common-mode range at different PGA gains for a maximum differential input voltage.

Figure 89. Maximum Common-Mode Voltage Range for a Maximum Differential Input Signal

The AD7779 provides a common-mode voltage pin ( $AVDD1x + AVSSx/2$ ), VCM, for the single-supply, pseudo differential, or true differential input configurations.

## TRANSFER FUNCTION

The AD7779 can operate with up to a 3.6 V reference, typical at 2.5 V, and converts the differential voltage between the analog inputs ( $AINx+$  and  $AINx-$ ) into a digital output. The ADC converts the voltage difference between the analog input pins ( $AINx+ - AINx-$ ) into a digital code on the output. The 24-bit conversion result is in MSB first, twos complement format, as shown in Table 15 and Figure 90.

Table 15. Output Codes and Ideal Input Voltages for  $PGA = 1\times$ 

Condition	Analog Input ( $AINx+ - AINx-$ ), $V_{REF} = 2.5\text{ V}$	Digital Output Code, Twos Complement (Hex)
FS - 1 LSB	+2.499999702 V	0x7FFFFF
Midscale + 1 LSB	+298 nV	0x000001
Midscale	0 V	0x000000
Midscale - 1 LSB	-298 nV	0xFFFFF
-FS + 1 LSB	-2.499999702 V	0x800001
-FS	-2.5 V	0x800000

Figure 90. Transfer Function

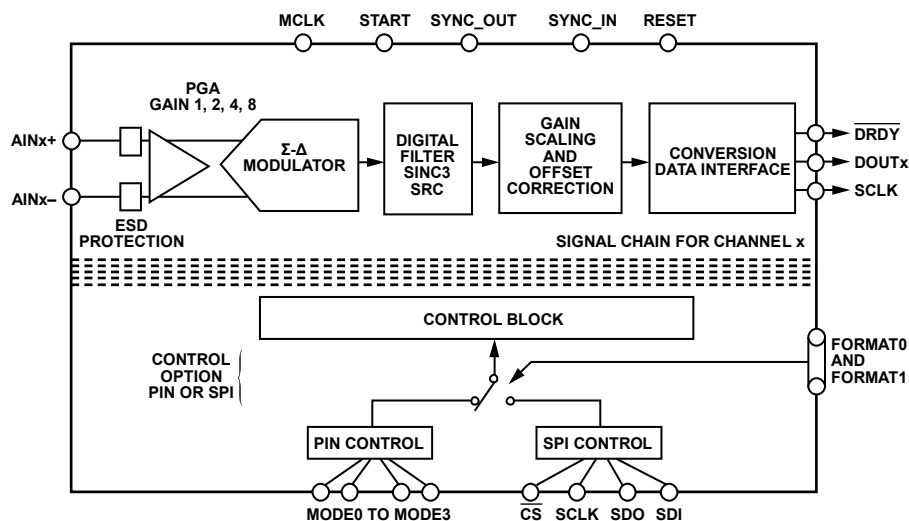

Figure 91. Top Level Core Signal Chain

## CORE SIGNAL CHAIN

Each  $\Sigma$ - $\Delta$  ADC channel on the AD7779 has an identical signal path from the analog input pins to the digital output pins.

Figure 91 shows a top level implementation of this signal chain. Prior to each  $\Sigma$ - $\Delta$  ADC, a PGA maps sensor outputs into the ADC inputs, providing low input current in dc ( $\pm 4$  nA, input current, and  $\pm 1.5$  nA differential input current), an 8 pF input capacitance in ac, and configurable gains of 1, 2, 4, and 8. See the AN-1392 for more information. Each ADC channel has its own  $\Sigma$ - $\Delta$  modulator, which oversamples the analog input and passes the digital representation to the digital filter block. The data is filtered, scaled for gain and offset, and is then output on the data interface.

To minimize power consumption, the channels can be individually disabled.

## CAPACITIVE PGA

Each  $\Sigma$ - $\Delta$  ADC has a dedicated PGA, offering gain ranges of 1, 2, 4, and 8. This PGA reduces the need for an external input buffer and allows the user to amplify small sensor signals to use the full dynamic range of the AD7779.

The PGA maximize the signal chain dynamic range for small sensor output signals.

The AD7779 uses chopping of the PGA to minimize offset and offset drift in the input amplifier, reducing the  $1/f$  noise as well. For the AD7779, the chopping frequency is set to 64 kHz for high resolution mode, and 16 kHz for low power mode (see the AN-1311 for more information). The chopping tone is rejected by the SINC filter.

To minimize intermodulation effects that may cause image in the band of interest, it is recommended to limit the input signal bandwidth to  $2/3$  of the chop frequency.

The capacitive PGA common-mode voltage does not depend on the gain, and can be any value as long as the input signal voltage is within  $AVSSx + 100$  mV to  $AVDD1x - 100$  mV. See Figure 89

for the maximum common-mode voltage at maximum differential input signals.

## INTERNAL REFERENCE AND REFERENCE BUFFERS

The AD7779 integrates a 2.5 V, 10 ppm/ $^{\circ}$ C typical, voltage reference that is disabled at power-up. The buffered reference is available at Pin 49 and offers up to 10 mA of continuous current. A 100 nF capacitor is required if the reference is enabled.

In applications where a low noise reference is required, it is recommended to add a low-pass filter (LPF) with a cutoff frequency ( $f_{CUTOFF}$ ) below 10 Hz to the REF\_OUT pin. Connect the output of this filter to REFx+, and connect AVSSx to REFx-. In this scenario, configure the  $\Sigma$ - $\Delta$  reference as external. An example of performance with and without the output filter is shown in Figure 92.

Figure 92. SNR Adding External LPF with  $V_{REF}$  = Internal Reference and  $f_{CUTOFF} = 10$  Hz

The AD7779 can be used with an external reference connected between the REFx+ and REFx- pins. Recommended reference voltage sources for the AD7779 include the ADR441 and ADR4525 family of low noise, high accuracy voltage references.

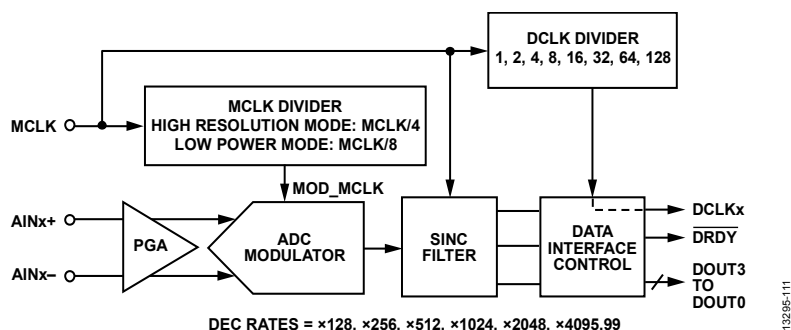

Figure 93. Clock Generation on the AD7779

The reference buffers can be operated in three different modes: buffer enabled mode, buffer bypassed mode, and buffer precharged mode.

In buffer enabled mode, the buffer is fully enabled, minimizing the current requirements from the external references. Note that the buffer output voltage headroom is  $\pm 100$  mV from the rails.

In buffer bypassed mode, the external reference is directly connected to the ADC reference capacitors; the reference must provide enough current to correctly charge the internal ADC reference capacitors. In this mode of operation, a degradation in crosstalk is expected because the ADC channels are not isolated from each other.

Buffer precharged (pre-Q) mode is the default operation mode. It is a hybrid mode where the internal reference buffers are connected during the initial acquisition time to precharge the internal ADC reference capacitors. During the final phase of the acquisition, the reference is connected directly to the ADC capacitors. This mode has some benefits compared to the buffer enabled and buffer bypassed modes. In buffer precharged mode, the reference current requirements are minimized compared to buffer bypassed mode the noise contribution from the internal reference buffers is removed (compared to buffer enabled mode).

In buffer precharged mode, the headroom/footroom of the buffer reference is not applicable because the reference sets the final voltage in the ADC reference capacitors.

## INTEGRATED LDOs

The AD7779 has three internal LDOs to regulate the internal supplies: two LDOs for the analog block and one LDO for the digital core. The internal LDOs requires an external 1  $\mu$ F decoupling capacitor on the DREGCAP, AREG1CAP, and the AREG2CAP pins. The LDO slew rate may be low because it depends on the main supply slew rate; therefore, a hardware reset generated by pulsing the RESET pin at power-up is required to guarantee that the digital block initializes correctly.

## CLOCKING AND SAMPLING

The AD7779 includes eight  $\Sigma$ - $\Delta$  ADC cores. Each ADC receives the same master clock signal. The AD7779 requires a maximum external MCLK frequency of 8192 kHz for high resolution mode and 4096 kHz for low power mode. The MCLK is internally divided by 4 in high resolution mode and by 8 in low power mode to produce the modulator MCLK (MOD\_MCLK) signal used as the modulator sampling clock for the ADCs. The MCLK can be decreased to accommodate lower ODRs if the minimum ODR selected by the SINC filter is not low enough. If the external clock is lower than 250 kHz, set the CLK\_QUAL\_DIS bit (in SPI control mode only).

The AD7779 integrates an internal oscillator clock that initializes the internal registers at power-up. The CLK\_SEL pin defines the external clock used after initialization (see Table 16).

Table 16. Clock Sources

CLK_SEL State	Clock Source	Connection
0	CMOS	Input to XTAL2/MCLK, IOVDD logic level. XTAL1 must be tied to DGND.
1	Crystal	Connected between XTAL1 and XTAL2/MCLK.

The MCLK signal generates the DCLK output signal, which in turn clocks the  $\Sigma$ - $\Delta$  conversion data from the AD7779, as shown in Figure 93.

## DIGITAL RESET AND SYNCHRONIZATION PINS

An external pulse in the SYNC\_IN pin generates the internal reset of the digital block; this pulse does not affect the data programmed in the internal registers. A pulse in this pin is required in two cases as follows:

- After updating one or more registers directly related to the sinc3 filter. These are power mode, offset, gain, and phase compensation.
- To synchronize multiple devices, the pulse in the SYNC\_IN pin must be synchronous with MCLK.

There are two different ways to achieve a synchronous pulse if the controller/processor cannot generate it, as follows:

- Applying an asynchronous pulse on the  $\overline{\text{START}}$  pin, which is then internally synchronized with the external MCLK clock, and the resulting synchronous signal is output on the  $\overline{\text{SYNC\_OUT}}$  pin.
- Triggering the  $\overline{\text{SYNC\_OUT}}$  internally. When the AD7779 is configured in SPI control mode, toggling Bit 0 in the  $\text{GEN\_USER\_CONFIG\_2}$  register generates a synchronous pulse that is output on the  $\overline{\text{SYNC\_OUT}}$  pin.

The  $\overline{\text{SYNC\_IN}}$  and  $\overline{\text{SYNC\_OUT}}$  pins must be externally connected if internal synchronization is used.

If multiple AD7779 devices must be synchronized, the  $\overline{\text{SYNC\_OUT}}$  pin of one device can be connected to multiple devices. This synchronization method requires the use of a common MCLK signal for all the AD7779 devices connected, as shown in Figure 94.

If the  $\overline{\text{START}}$  pin is not used, tie it to IOVDD.

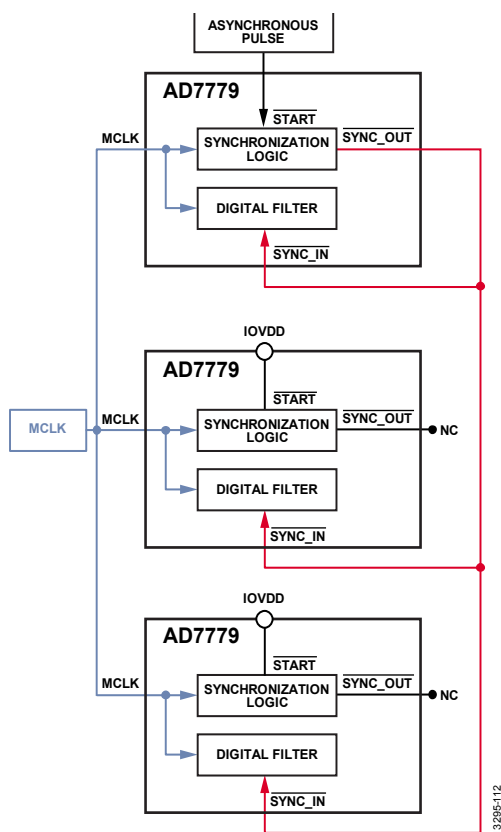

Figure 94. Multiple AD7779 Synchronization

## DIGITAL FILTERING

The AD7779 offers a low latency sinc3 filter. Most precision  $\Sigma$ - $\Delta$  ADCs use sinc3 filters because the sinc3 filter offers a low latency path for applications requiring low bandwidth signals, for example, in control loops or where application specific postprocessing is required. The digital filter adds notches at multiples of the sampling frequency.

The digital filter implements three main notches, one at the maximum ODR (16 kHz or 8 kHz, depending on the power mode) and another two at the ODR frequency selected to stop noise aliasing into the pass band.

Figure 95 shows the typical filter transfer function for the high resolution and low power modes using a decimation rate of 256 samples.

Figure 95. Sinc3 Frequency Response

The sample rate converter featured allows fine tuning of the decimation rate, even for noninteger multiples of the decimation rate. See the Sample Rate Converter (SRC) section for more information on filter profiles for noninteger decimation rates.

## SHUTDOWN MODE

The AD7779 can be placed in shutdown mode by pulling AVDD2 to ground and connecting 1 M $\Omega$  resistance, pulled low, to XTAL2. In this mode, the average current consumption is reduced to 1 mA, as shown in Figure 96.

Figure 96. Shutdown Current

## CONTROLLING THE AD7779

The AD7779 can be controlled using either pin control mode or SPI control mode.

Pin control mode allows the AD7779 to be hardwired to predefined settings that offer a subset of the overall functionality of the AD7779. In this mode, the SRC and diagnostic features or extended errors source are not available.

Controlling the AD7779 over the SPI interface allows the user access to the full monitoring, diagnostic, and  $\Sigma$ - $\Delta$  control functionality. SPI control offers additional functionality such as offset, gain, and phase correction per channel, in addition to access to the flexible SRC to achieve a coherent sampling.

See Table 17 for more details about these different configurations.

### PIN CONTROL MODE

In pin control mode, the AD7779 is configured at power-up based on the level of the mode pins, MODE0, MODE1, MODE2, and MODE3. These four pins set the following functions on the AD7779: the mode of operation, the decimation rate/ODR, the PGA gain, and the reference source, as shown in Table 18.

Due to the limited number of mode pins and the number of options available, the PGA gain control is grouped into blocks

of 4, and the ODR is selected for the maximum value defined by the decimation rate; ODR (kSPS) = 2048/decimation for high resolution mode, and ODR (kSPS) = 512/decimation for low power mode.

Depending on the mode selected, the device is configured to use an external or an internal reference.

The conversion data can be read back using the SPI interface or the data output interface, as shown in Table 17. If the data output interface is used to read back the data from the conversions, the number of DOUTx lines enabled and the number of clocks required for the  $\Sigma$ - $\Delta$  data transfer are determined by the logic level of the CONV\_SAR, FORMAT0, and FORMAT1 pins. In this case, the DCLK2, DCLK1, and DCLK0 pins select the  $\Sigma$ - $\Delta$  output interface and control the DCLKx divide function, which is a submultiple of MCLK, as shown in Table 19. The DCLKx divide function sets the frequency of the data output interface DCLKx signal. The DCLK minimum frequency depends on the decimation rate and operation mode. See the Data Output Interface section for more details about the minimum DCLKx frequency.

All the pins that define the AD7779 configuration mode are reevaluated each time the SYNC\_IN pin is pulsed. The typical connection diagram for pin control mode is shown in Figure 97.

Table 17. Format of the Data Interface

CONV_SAR State	FORMAT1	FORMAT0	Control Mode	Data Output Mode
1	0	0	Pin	SPI output
	0	1	Pin	SPI output
	1	0	Pin	SPI output
	1	1	SPI	Defined in Register 0x013 and/or Register 0x014

## SPI CONTROL

The second option for control and monitoring the AD7779 is via the SPI interface. This option allows access to the full functionality on the AD7779, including access to the SAR converter, phase synchronization, offset and gain adjustment, diagnostics and the SRC. To use the SPI control, set the FORMAT0 and FORMAT1 pins to logic high.

In this mode, the SPI interface can also be used to read the  $\Sigma$ - $\Delta$  conversion data by setting the SPI\_SLAVEMODE\_EN bit.

The typical connection diagram for SPI control mode is shown in Figure 98.

### Functionality Available in SPI Mode

SPI control of the AD7779 offers the super set of the functions and diagnostics. The SPI Control Functionality section describes the functionality and diagnostics offered when in SPI control mode.

### Offset and Gain Correction

Offset and gain registers are available for system calibration. The gain register is preprogrammed during final production for a PGA gain of 1, but can be overwritten with a new value if required.

The gain register is 24 bits long and is split across three registers, CHx\_GAIN\_UPPER\_BYTE, CHx\_GAIN\_MID\_BYTE, and CHx\_GAIN\_LOWER\_BYTE, which set the gain on a per channel basis.

The gain value is relative to 0x555555, which represents a gain of 1.

The offset register is 24 bits long and is spread across three byte registers, CHx\_OFFSET\_UPPER\_BYTE, CHx\_OFFSET\_MID\_

BYTE, and CHx\_OFFSET\_LOWER\_BYTE. The default value is 0x000000 at power-up. Program the offset as a two's complement, signed 24-bit number. If the channel gain is set to its nominal value of 0x555555, an LSB of offset register adjustment changes the digital output by  $-4/3$  LSBs.

As an example of calibration, the offset measured is  $-200$  LSB (with both AINx± pins connected to the same potential).

An offset adjustment of  $-150$  changes the digital output by  $-150 \times (-4/3) = 200$  LSBs (gain value = 0x555555), representing this number as two's complement,  $0xFFFFFFFF - 0x96 + 1 = 0xFFFF70$ .

- CHx\_OFFSET\_UPPER\_BYTE = 0xFF
- CHx\_OFFSET\_MID\_BYTE = 0xFF
- CHx\_OFFSET\_LOWER\_BYTE = 0x70

Note that the offset compensation is performed before the gain compensation. The gain is programmed during final testing for  $PGA_{GAIN} = 1$ . The gain register values can be overwritten; however, after a reset or power cycle, the gain register values revert to the hard coded programmed factory setting.

If the gain required is 0.75 of the nominal value (0x555555), the value that must be programmed is

$$0x555555 \times 0.75 = 0x400000$$

Then, an LSB of the offset register adjustment changes the digital output by  $-4/3 \times 0.75 = 1$  LSB.

- CHx\_GAIN\_UPPER\_BYTE = 0x40
- CHx\_GAIN\_MID\_BYTE = 0x00
- CHx\_GAIN\_LOWER\_BYTE = 0x00

## SPI Control Functionality

### Global Control Functions

The following list details the global control functions of the AD7779:

- High resolution and low power modes of operation
- Output data rate: sample rate converter (SRC)
- VCM buffer power-down
- Internal/external reference selection
- Enable, precharged, or bypassed reference buffer modes
- Internal reference power-down
- SAR diagnostic mux
- SAR power-down
- GPIO write/read
- SPI SAR conversion readback
- SPI slave mode—read  $\Sigma$ - $\Delta$  results
- SDO and DOUT drive strength
- DOUT mode
- DCLK division
- Internal LDO bypassed
- CRC protection: enabled or disabled

### Per Channel Functions

The following list details the per channel functions of the AD7779:

- PGA gain.
- $\Sigma$ - $\Delta$  channel power-down.
- Phase delay: synchronization phase offset per channel.
- Calibration of offset.
- Calibration of gain.
- $\Sigma$ - $\Delta$  input signal mux.
- Channel error register.
- PGA gain.

### Phase Adjustment

The AD7779 phase delay can be adjusted to compensate for phase mismatches between channels due to sensors or signal channel phase errors connected to the AD7779. Achieve phase adjustment by programming the CHx\_SYNC\_OFFSET register. This programming delays the synchronization signal by a certain number of modulator clocks, MOD\_CLKs, to individually initiate the digital filter for each  $\Sigma$ - $\Delta$  ADC.

The phase adjustment register is read during the pulse; consequently, any further changes on the register have no effect unless a pulse is generated (see the Digital Reset and Synchronization Pins section for more information on how to generate a pulse in the pin).

The phase offset register is multiplied internally by a factor (n), that depends on the decimation rate, as shown in Table 20.

**Table 20. Phase Adjustment vs. Decimation Rate**

Phase Adjustment Compensation (n)	Decimation Rate
$\times 1$	$\leq 255$
$\times 2$	$\leq 511$
$\times 4$	$\leq 1023$
$\times 8$	$\leq 2047$
$\times 16$	$\leq 4095$

The maximum phase delay cannot be equal to or greater than the decimation rate. If this is the case, the value changes internally to the decimation rate value minus 1.

When the CHx\_SYNC\_OFFSET register is written it automatically overwrites itself multiplied by the corresponding factor (n), as defined in Table 20. As CHx\_SYNC\_OFFSET is only 8 bits long, the resulting value will be scaled down to fit 8 bits. In order to know whether the phase adjustment has clipped or not, see Table 21.

**Table 21.**

CHx_SYNC_OFFSET $\times$ n	CHx_SYNC_OFFSET Overwrite
$\leq 255$	CHx_SYNC_OFFSET $\times$ n
$\leq 511$	CHx_SYNC_OFFSET $\times$ n/2
$\leq 1023$	CHx_SYNC_OFFSET $\times$ n/4
$\leq 2047$	CHx_SYNC_OFFSET $\times$ n/8
$\leq 4095$	CHx_SYNC_OFFSET $\times$ n/16

As an example, the phase mismatch between Channel 0 and Channel 1 is  $5^\circ$ , and the ODR is 5 kSPS in high resolution mode. In this case, the decimation rate is 2048 kHz/5 kHz = 409.6, which means that the offset register value is multiplied internally by 2.

Assuming an input signal of 50 Hz, the number of MOD\_MCLK pulses required to sample a full period is 2048 kHz/50 Hz = 40960 >  $360^\circ/40960 = 0.00878^\circ$ .

If a  $5^\circ$  delay is required, the number of MOD\_MCLK delays must be 569 ( $5^\circ/0.00878^\circ$ ) because the offset register is multiplied by 2; the final offset register value is  $409.6/2 = 569/2$ , which gives a negative value. In this case, if the offset value programmed to the register is higher than 204 (for example,  $210 \times 2 = 420$ ), the value is internally changed to 408, resulting in a phase compensation of  $408 \times 0.00878^\circ = 3.58^\circ$ .

### PGA Gain

The PGA gain can be selected individually by appropriately selecting Bits[7:6] in the CHx\_CONFIG register, as shown in Table 22.

**Table 22. PGA Gain Settings via CHx\_CONFIG**

CHx_CONFIG, Bits[7:6] Setting	PGA Gain Setting
00	$\times 1$
01	$\times 2$
10	$\times 4$
11	$\times 8$

If the  $\Sigma$ - $\Delta$  reference is updated, it is recommended to apply a pulse on the SYNC\_IN pin to remove invalid samples during the transition of the reference

### Decimation

The decimation defines the sampling frequency as follows:

- In high resolution mode, the sampling frequency = MCLK/ (4 × decimation)
- In low power mode, the sampling frequency = MCLK/ (8 × decimation)

Refer to the Sample Rate Converter (SRC) section for more information.

### GPIO Pins

If the AD7779 operates in SPI control mode, the mode pins operate as GPIO pins, as shown in Figure 99. The GPIO pins can be configured as inputs or outputs in any order.

Figure 99. GPIO Pin Functionality

Configuration control and readback of the GPIO pins are dealt with by Bits[2:0] in the GPIO\_CONFIG register (0 = input, 1 = output) and the GPIO\_DATA register. Among other uses, the GPIOs can control an external mux connected to the auxiliary inputs of the SAR ADC. Use this mux to verify the results on the  $\Sigma$ - $\Delta$  ADCs.

In addition, the GPIO pins can be used to externally trigger a new decimation rate. Refer to the Sample Rate Converter (SRC) section for more information about this functionality.

### $\Sigma$ - $\Delta$ Reference Configuration

The AD7779 can operate with internal or external references. In addition, for diagnostic purposes, the analog supply can be used as a reference, as shown in Table 23.

Table 23.  $\Sigma$ - $\Delta$  References

Setting for ADC_MUX_CONFIG, Bits[7:6]	Channel 0 to Channel 3	Channel 4 to Channel 7
00	REF1+/REF1–	REF2+/REF2–
01	Internal reference	Internal reference
10	AVDD1A/AVSS1A	AVDD1B/AVSS1B
11	REF1–/REF1+	REF2–/REF2+

Reference buffer operation is described in Table 24. The selected reference and buffer operation mode affect all channels.

If the  $\Sigma$ - $\Delta$  reference is updated, it is recommended to apply a pulse on the SYNC\_IN pin to remove invalid samples during the transition of the reference.

Table 24. Reference Buffer Operation Modes

Reference Buffer Operation Mode	REFx+	REFx–
Enabled	BUFFER_CONFIG_1, Bit 4 = 1; BUFFER_CONFIG_2, Bit 7 = 0	BUFFER_CONFIG_1, Bit 3 = 1; BUFFER_CONFIG_2, Bit 6 = 0
Precharged	BUFFER_CONFIG_1, Bit 4 = 1; BUFFER_CONFIG_2, Bit 7 = 1	BUFFER_CONFIG_1, Bit 3 = 1; BUFFER_CONFIG_2, Bit 6 = 1
Disabled	BUFFER_CONFIG_1, Bit 4 = 0	BUFFER_CONFIG_1, Bit 3 = 0

Table 25. Additional Disable Power-Down Blocks

Block	Register	Notes
VCM	GENERAL_USER_CONFIG_1, Bit 5	Enable by default
Reference Buffer	BUFFER_CONFIG_1, Bits[4:3]	Precharge mode by default
Internal Reference Buffer	GENERAL_USER_CONFIG_1, Bit 4	Disable by default
$\Sigma$ - $\Delta$ Channel	CH_DISABLE, Bits[7:0]	All channels enable
SAR	GENERAL_USER_CONFIG_1, Bit 3	Disable by default
Internal Oscillator	GENERAL_USER_CONFIG_1, Bit 2	Enable by default

### Power Modes

The AD7779 offers different power modes to improve the power efficiency, high resolution and low power mode, which can be controlled via GENERAL\_USER\_CONFIG\_1, Bit 6. To further reduce the power, additional blocks can be disabled independently, as described in Table 25.

If the power mode changes, a pulse on the SYNC\_IN pin is required.

### LDO Bypassing

The internal LDOs can be individually bypassed and an external supply can be applied directly to AREG1CAP, AREG2CAP, or DREGCAP pins. Table 26 shows the absolute minimum and maximum supplies for these pins, as well as the associated register used to bypass the regulator.

Table 26. LDO Bypassing

LDO	BUFFER_CONFIG_2, Bits[2:0] <sup>1</sup>	Supply	
		Max (V)	Min (V)
AREG1CAP	1XX	1.9	1.85
AREG2CAP	X1X	1.9	1.85
DREGCAP	XX1	1.98	1.65

<sup>1</sup> X means don't care.

### DIGITAL SPI INTERFACE

The SPI serial interface on the AD7779 consists of four signals: CS, SDI, SCLK, and SDO. A typical connection diagram of the SPI interface is shown in Figure 100.

Figure 100. SPI Control Interface—AD7779 is the SPI Slave, Digital Signal Processor (DSP)/Field Programmable Gate Array (FPGA) is the Master

The SPI interfaces operates in Mode 0 and Mode 3, CPOL = 0, CPHA = 0 (Mode 0) or CPOL = 1, CPHA = 1 (Mode 3).

In pin control mode, the SDO can be used to read back the  $\Sigma$ - $\Delta$  results, depending on the level of the CONV\_SAR pin, as described in Table 17.

In SPI control mode, the SPI interface transfers data into the on-chip registers while the SDO pin reads back data from the on-chip registers or reads the SAR or the  $\Sigma$ - $\Delta$  conversions results, depending on the selected operation mode.

The SDO data source in SPI control mode is defined by the GENERAL\_USER\_CONFIG\_2 and GENERAL\_USER\_CONFIG\_3 registers, as described in Table 27.

Table 27. SPI Operation Mode in SPI Control Mode

GENERAL_USER_CONFIG_2, Bit 5 Setting	GENERAL_USER_CONFIG_3, Bit 4 Setting	Mode
0	0	Internal register
0	1	$\Sigma$ - $\Delta$ data conversion
1	X	SAR conversion

In SPI control mode, there are four different levels of I/O strength on the SDO pin, which can be selected in GENERAL\_USER\_CONFIG\_2, Bits[4:3], as described in Table 28.

Table 28. SDO Strength

GENERAL_USER_CONFIG_2, Bits[4:3] Setting	Mode
0	Nominal
0	Strong
1	Weak
1	Extra strong

SCLK is the serial clock input for the device. All data transfers (on either SDO or SDI) occur with respect to this SCLK signal.

The SPI interface can operate in multiples of eight bits. For example, in SPI control mode, if the SDO pin is used to read back the data from the internal register or the SAR ADC, the data frame is 16 bits wide (CRC disabled), as shown in Figure 101, or 24 bits wide (CRC enabled), as shown in Figure 102. In this case, the controller can generate one frame of 16 bits/24 bits (with and without the CRC enabled), or 2/3 frames of 8 bits (with and without the CRC enabled). When the SDO pin is used to read back the data from the  $\Sigma$ - $\Delta$  channels, 64 bits must be read back from the controller (in this case, the controller can generate a frame of 64 bits: either  $2 \times 32$  bits,  $4 \times 16$  bits, or  $8 \times 8$  bits).

#### SPI CRC—Checksum Protection (SPI Control Mode)

The AD7779 has a checksum mode that improves SPI interface robustness in SPI control mode. Using the checksum ensures that only valid data is written to a register and allows data read from the device to be validated. The SPI CRC can be enabled by setting the SPI\_CRC\_TEST\_EN bit. If an error occurs during a register write, the SPI\_CRC\_ERR is set in the error register.

Enabling the SPI\_CRC\_TEST\_EN bit results in a CRC checksum being performed on all the R/W operations. When SPI\_CRC\_TEST\_EN is enabled, an 8-bit CRC word is appended to every SPI transaction for SAR and register map operations. For more information on  $\Sigma$ - $\Delta$  readback operations, see the CRC Header section.

To ensure that the register write is successful, it is recommended to read back the register and verify the checksum.

For CRC checksum calculations, the following polynomial is always used:  $x^8 + x^2 + x + 1$ . See the SPI Control Mode Checksum section for more information.

#### SPI Read/Write Register Mode (SPI Control Mode)

The AD7779 has on-board registers to configure and control the device.

The registers have 7-bit addresses—the 7-bit register address on the SDI line selects the register for the read/write function. The 7-bit register address follows the R/W bit in the SDI data. The 8 bits on the SDI line following the 7-bit register address are the data to be written to the selected register if the SPI is a write transfer. Data on the SDI line is clocked into the AD7779 on the rising edge of SCLK, as shown in Figure 3.

The data on the SDO line during the SPI transfer contains the 8-bit 0010 0000 header: 8 bits of register data in the case of a read (R) operation, or 8 zeros in the case of a write (W) operation.

With the CRC disabled, the basic data frame on the SDI line during the transfer is 16 bits long, as shown in Figure 101. When the CRC is enabled, a minimum frame length of 24 SCLKs is required on SPI transfers. The 24 bits of data on the SDO line consist of an 8-bit header (0010 0000), 8 bits of data, and an 8-bit CRC (see Figure 102).

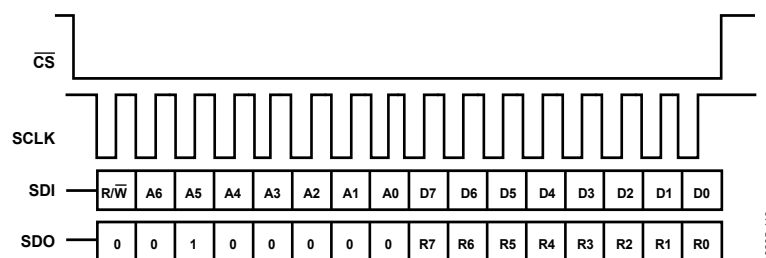

Figure 101. 16-Bit SPI Transfer—CRC Disabled

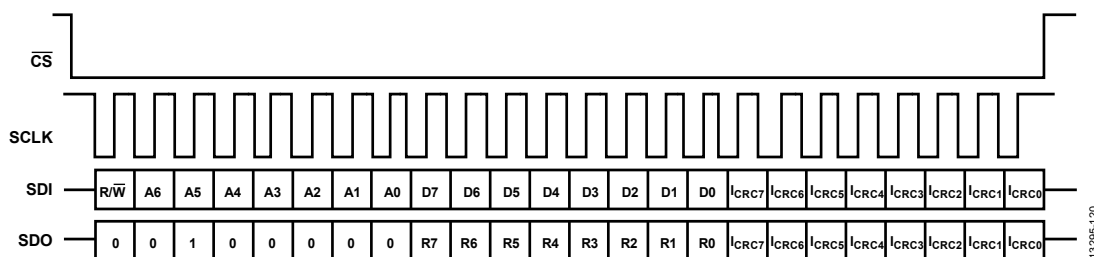

Figure 102. 24-Bit SPI Transfer—CRC Enabled

### SPI SAR Diagnostic Mode (SPI Control Mode)

Setting Bit 5 in the GENERAL\_USER\_CONFIG\_2 register configures the SDO line to shift out data from the SAR ADC conversions, as described in Table 27. The SAR ADC is disabled at power-up. To enable this ADC, set the PDB\_SAR bit.

In SAR mode, the AD7779 internal registers can be written to, but any readback command is ignored because the SDO data frame is dedicated to shift out the conversion results from the SAR ADC.

To exit this mode of operation, reset Bit 5 in the GENERAL\_USER\_CONFIG\_2 register.

The data on the SDO line during the SPI transfer contains a 4-bit 0010 header and 12 bits of the SAR conversion result if the CRC is disabled.

When the CRC is enabled, a minimum frame length of 24 SCLKs is required on SPI transfers. The 24 bits of data on the SDO line consist of a 4-bit header (0010), 12 bits of data, and an 8-bit CRC, as shown in Figure 103.

Per the SPI read/write register mode (see the SPI Read/Write Register Mode section), the SDI line contains the R/W bit, a 7-bit register address, 8 bits of data, and an 8-bit CRC (if enabled). To avoid unwanted writes to the internal register while the SAR conversions are read back through the SDO line, it is recommended to send a readback command, for example, 0x8000,

to the device, which is ignored because the SDO pin is used to shift out the content of the SAR ADC.

If consecutive conversions are performed in the SAR ADC, read back the result from the previous conversion before a new conversion is generated. Otherwise, the results are corrupted.

### $\Sigma$ - $\Delta$ Data, ADC Mode

In pin control mode, the SPI interface can be used to read back the  $\Sigma$ - $\Delta$  conversions as described in Table 17. In SPI control mode, the SPI interface reads back the  $\Sigma$ - $\Delta$  conversions by setting GENERAL\_USER\_CONFIG\_3, Bit 4, as described in Table 27; in this mode, the AD7779 internal register can be written to, but any readback command is ignored because the SDO data frame is dedicated to shifting out the conversion results from the  $\Sigma$ - $\Delta$  ADCs. To avoid unwanted writes to the internal register, it is recommended to send a readback command, for example, 0x8000, to the device, which is ignored because the SDO pin is used to shift out the content of the  $\Sigma$ - $\Delta$  ADC.

The SDO pin data can be read back in any multiple of 8 bits, for example, as 64 bits,  $2 \times 32$  bits,  $4 \times 16$  bits, or  $8 \times 8$  bits.

### SPI Software Reset

Keeping the SDI pin high during 64 consecutive clocks generates a software reset.

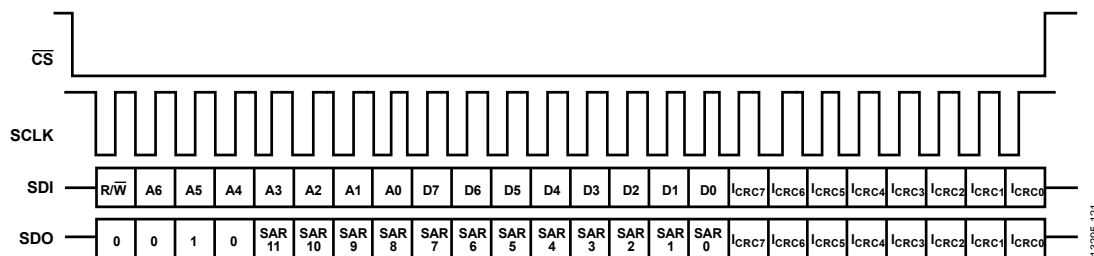

Figure 103. SAR ADC/Diagnostic Mode—CRC Enabled

Figure 104. SPI Used to Read Back the  $\Sigma$ - $\Delta$  ADC Data, in 24-Bit Frames

## DIAGNOSTICS AND MONITORING

### SELF DIAGNOSTICS ERROR

The [AD7779](#) includes self diagnostic features to guarantee the correct operation. If an error is detected, the ALERT pin is pulled high to generate an external interruption to the controller. In addition, the header of the  $\Sigma$ - $\Delta$  output data contains a bit used to inform the controller of a chip error (see the ADC Conversion Output—Header and Data section).

Both the ALERT pin and the bit (status header) are automatically cleared if the error is no longer present. The errors related to the SPI interface do not recover automatically; read back the appropriate register to clear the error, resetting both the ALERT pin and the bit.

If an error detector is manually disabled, it does not generate an internal error and, consequently, the register map or the ALERT pin and bit are not triggered.

There are different sources of errors, as described in Table 29. In pin control mode, it is not possible to check the error source, and some sources of error are not enabled. In SPI control mode, check the source of an error by reading the appropriate register bit.

The STATUS\_REG\_x register bits identify the register that generates an error, as summarized in Table 29.

**Table 29. Register Error Source**

Bit Name	Register Source
ERR_LOC_GEN2	GEN_ERR_REG_2
ERR_LOC_GEN1	GEN_ERR_REG_1
ERR_LOC_CH7	CH7_ERR_REG
ERR_LOC_CH6	CH6_ERR_REG
ERR_LOC_CH5	CH5_ERR_REG
ERR_LOC_CH4	CH4_ERR_REG
ERR_LOC_CH3	CH3_ERR_REG
ERR_LOC_CH2	CH2_ERR_REG
ERR_LOC_CH1	CH1_ERR_REG
ERR_LOC_CH0	CH0_ERR_REG
ERR_LOC_SAT_CH6_7	CH6_7_SAT_ERR
ERR_LOC_SAT_CH4_5	CH4_5_SAT_ERR
ERR_LOC_SAT_CH2_3	CH2_3_SAT_ERR
ERR_LOC_SAT_CH0_1	CH0_1_SAT_ERR

In addition, STATUS\_REG\_x has a bit that indicates if any internal error bit is set. This bit clears if the error is no longer present and the register is read back.

The INIT\_COMPLETE bit in the STATUS\_REG\_3 indicates that the device is initialized correctly. This bit is not an error but an indicator.

### General Errors

#### MCLK Switch Error (SPI Control Mode)

After power-up, the [AD7779](#) initiates a clocking handover sequence to pass clocking control to the external oscillator, or the CMOS clock. In SPI mode, if an error occurs in the handover,

the EXT\_MCLK\_SWITCH\_ERR bit is set in the general error register, GEN\_ERR\_REG\_2.

If EXT\_MCLK\_SWITCH\_ERR is set, this means that the device is operating off the internal oscillator.

To use a slow external clock (<265 kHz), set the CLK\_QUAL\_DIS bit. Setting this bit also clears the error bit.

If the external clock is between 132 kHz and 265 kHz, depending on the internal synchronization between internal oscillator and external clock, the error may not trigger. However, it is still recommended to set the CLK\_QUAL\_DIS bit.

If a slow clock is not in use and the error triggers, a reset is required.

### Reset Detection

The [AD7779](#) general error register contains a RESET\_DETECTED bit. This bit is asserted if a reset pulse is applied to the [AD7779](#) and is cleared by reading the general error register. This bit indicates that the power-on reset (POR) initialized correctly on the device. In addition, this pin can be used to detect an unexpected device reset or glitch on the RESET pin. To reset this error signal in SPI control mode, toggle the SYNC\_IN pin or read from the general error register, GEN\_ERR\_REG\_2. To reset this error signal in pin control mode, toggle the SYNC\_IN pin.

### Internal LDO Status

The [AD7779](#) has three internal LDOs to regulate the internal analog and digital supply rails. The LDOs have internal power supply monitors. Internal comparators monitor and flag errors with these supplies after they pass a predetermined limit.

The ALDO1\_PSM\_ERR, ALDO2\_PSM\_ERR, and DLDO\_PSM\_ERR bits indicate either an LDO malfunction, or, if the LDOs are bypassed, an incorrect external supply.

The internal analog and digital voltage monitors can be disabled by appropriately selecting the LDO\_PSM\_TEST\_EN bits.

Use the SAR ADC to verify the error.

Additionally, the levels of the internal monitors can be manually triggered to check if the detector works correctly by appropriately setting the bits in the LDO\_PSM\_TRIP\_TEST\_EN register. These bits increase the comparator window threshold above the LDO outputs, forcing the comparator to trigger.

### ROM and MEMMAP CRC

If an error is found at power-up during the ROM verification, or if the internal memory map is corrupted, the [AD7779](#) generates an error and sets MEMMAP\_CRC\_ERR or ROM\_CRC\_ERR, depending on the source of the error.

The checker can be disabled by clearing the MEMMAP\_CRC\_TEST\_EN and ROM\_CRC\_TEST\_EN bits.

The device must be reset if any of these errors trigger.

## Σ-Δ ADC Errors

### Reference Detect (SPI Control Mode)

In SPI control mode, the AD7779 includes on-chip circuitry to detect if there is a valid reference for conversions or calibrations. If the voltage between the selected REFx+ and REFx- pins goes below 0.7 V, the AD7779 detects that it no longer has a valid reference. CHx\_ERR\_REF\_DET can be interrogated to identify the affected channel, which clears the bit register if the error is no longer present. The voltage detector can be disabled by clearing the REF\_DET\_TEST\_EN bit.

Use the Σ-Δ ADC diagnostic or the SAR ADC to verify the error.

### Overvoltage and Undervoltage Events

The AD7779 includes on-chip overvoltage/undervoltage circuitry on each analog input pin. When the voltage on an analog input pin goes above  $AVDD1x + 40\text{ mV}$ , the CHx\_ERR\_AINx\_OV bit is set. The error disappears if the input voltage falls below  $AVDD1x - 40\text{ mV}$ .

If an undervoltage event occurs ( $AVSSx - 40\text{ mV}$ ), the CHx\_ERR\_AINx\_UV bit is set. The error disappears if the input voltage increases to  $AVSSx + 40\text{ mV}$ .

The CHx\_ERR\_AINM\_UV, CHx\_ERR\_AINM\_OV, CHx\_ERR\_AINP\_UV, and CHx\_ERR\_AINP\_OV bits can be read back to verify the affected channel input, which clears the bit register if the error is no longer present. The overvoltage and undervoltage detection can be disabled independently by clearing the AINM\_UV\_TEST\_EN, AINM\_OV\_TEST\_EN, AINP\_UV\_TEST\_EN, or AINP\_OV\_TEST\_EN bits.

The input voltage can be checked independently with the SAR ADC.

### Modulator Saturation

The AD7779 includes modulator saturation detection on each of the Σ-Δ ADCs. If 20 consecutive codes for the modulator are either all 1s or 0s, this is flagged as a modulator saturation event. Reading the CHx\_ERR\_MOD\_SAT register clears the bit if the error corrects itself.

Modulator saturation detection can be disabled by clearing the MOD\_SAT\_TEST\_EN bit.

Note that the modulator input voltage is attenuated internally, which means that a modulator output of all 1s or 0s represents a modulator that is out of bounds and that a RESET pulse is required.

### Filter Saturation

The AD7779 includes digital filter saturation detection on each Σ-Δ ADC channel. This detection indicates that the filter output is out of bounds, which represents an output code approximately 20% higher than positive or negative full scale. Reading the CHx\_ERR\_FILTER\_SAT bit clears the bit if the error corrects itself.

The detection can be disabled by clearing FILTER\_SAT\_TEST\_EN bit.

## Output Saturation

An output saturation event can occur when gain and offset calibration causes the output from the digital filter to clip at either positive or negative full scale. The output does not wrap. Reading the CHx\_ERR\_OUTPUT\_SAT bit clears the bit if the error corrects itself.

The detection can be disabled by clearing OUTPUT\_SAT\_TEST\_EN bit.

### SPI Transmission Errors (SPI Control Mode)

All SPI errors clear after reading GEN\_ERR\_REG\_1, which contains the SPI errors. These errors are not recovered automatically and, consequently, the ALERT pin and the ALERT bit remain set until the error register is read back, and new SPI frame is generated.

### CRC Checksum Error

If the CRC checksum is enabled by setting the SPI\_CRC\_TEST\_EN bit, an error bit, SPI\_CRC\_ERR, is raised if the CRC message does not match the message computed by the AD7779 internal CRC block. If the CRC message does not match the internally computed message, the register is not updated.

### SCLK Counter

If the number of clocks generated by the controller is not a multiple of 8 after  $\overline{\text{CS}}$  is pulled high, an error bit, SPI\_CLK\_COUNT\_ERR is raised. The last command multiple of 8 is executed; however, the SCLK counter can be disabled by setting the SPI\_CLK\_COUNT\_TEST\_EN bit.

### Invalid Read

When an invalid register is trying to read back, the SPI\_INVALID\_READ\_ERR bit is set.

The invalid readback address detection can be disabled by setting the SPI\_INVALID\_READ\_TEST\_EN bit.

### Invalid Write

When an invalid register is trying to write, the SPI\_INVALID\_WRITE\_ERR bit is set.

The invalid write address detection can be disabled by setting the SPI\_INVALID\_WRITE\_TEST\_EN bit.

## MONITORING USING THE AD7779 SAR ADC (SPI CONTROL MODE)

The AD7779 contains an on-chip SAR ADC for chip diagnostics, system diagnostics, or measurement verification. The SAR ADC has a 12-bit resolution. The AVDD4 and AVSS4 pins operate in complete independence of the Σ-Δ ADC supplies and, therefore, can be used for chip diagnostics in systems where functional safety is important. The reference for the SAR conversion process is taken from the SAR ADC supply voltage (AVDD4/AVSS4) and, therefore, the SAR analog input range is from AVSS4 to AVDD4.

The SAR ADC has a maximum throughput rate of 256 kSPS. The CONVST\_SAR pin initiates a conversion on the SAR ADC.

The maximum allowable frequency of the CONVST\_SAR pin is 256 kHz. If consecutive conversions are performed in the SAR ADC, read back the result from the previous conversion before a new conversion is generated. Otherwise, the results are corrupted.

The SAR ADC is only available in SPI control mode. To read conversion results from the SAR ADC, set the SAR\_DIAG\_MODE\_EN bit. After this bit is set, all data shift out from the SDO pin are from the SAR ADC register, as shown in Figure 104.

The CONVST\_SAR signal can be internally deglitched to avoid false triggers.

**Table 30. SAR Synchronization and Deglitching**

CONVST_DEGLITCH_DIS	Effect on CONVST_SAR
11	CONVST_SAR goes directly to the SAR
10	CONVST_SAR reaches the SAR when it is 1.5 MCLK cycles wide

Increase the acquisition time by 1.5/MCLK when the deglitch circuitry is enabled.

Prior to the SAR ADC, the AD7779 contains an internal multiplexer. This multiplexer can be configured over the SPI interface to set the inputs to the SAR ADC to be either internal circuit nodes in the case of diagnostics or to select the external AUXAIN+ and AUXAIN– pins.

Along with converting external voltages, the SAR ADC can be used to monitor the internal nodes on the AVDD, IOVDD, and DGND pins, and can monitor the DLDO and ALDO outputs. Some voltages are internally attenuated by 6, and the resulting voltage is applied to the SAR ADC, as shown in Table 31. This is useful because variations in the power supply voltage can be monitored.

The input multiplexer of the SAR is controlled by the GLOBAL\_MUX\_CONFIG register, and the different inputs available are described in Table 31.

The SAR ADC also contains an ADC driver amplifier, as shown in Figure 105. This amplifier settles the SAR input to 12-bit accuracy within the  $t_{33}$  time. This driver amplifier helps minimize the kickback from the SAR converter to the global diagnostic mux input circuit nodes.

Use the auxiliary inputs, AUXAIN+ and AUXAIN–, to validate the  $\Sigma$ - $\Delta$  measurements. While operating in SPI control mode,

the AD7779 has three available GPIO ports controlled via the SPI interface. The GPIO pins can be used to control an external, dual 8:1 multiplexer, which in turn is used to sample the eight  $\Sigma$ - $\Delta$  channels. Use this diagnostic in applications where functional safety is required. This diagnostic aids in removing the need for a secondary external ADC to validate primary measurements on the  $\Sigma$ - $\Delta$  channels.

#### Temperature Sensor

The internal die temperature can be measured with an error of  $\pm 2^{\circ}\text{C}$ .  $DV_{BE}$  is proportional to the temperature measured referred to  $25^{\circ}\text{C}$ .

$$\text{Temperature } (^{\circ}\text{C}) = \frac{DV_{BE} - 0.6 \text{ V}}{2 \text{ mV}}$$

**Table 31. SAR Mux Inputs**

SAR Input	Positive Signal	Negative Signal	Attenuation $\div 6$
0	AUXAIN+	AUXAIN–	No
1	$DV_{BE}$	AVSSx	No
2	REF1+	REF1–	No
3	REF2+	REF2–	No
4	REF_OUT	AVSSx	No
5	VCM	AVSSx	No
6	AREG1CAP	AVSSx	Yes
7	AREG2CAP	AVSSx	Yes
8	DREGCAP	DGND	Yes
9	AVDD1A	AVSSx	Yes
10	AVDD1B	AVSSx	Yes
11	AVDD2A	AVSSx	Yes
12	AVDD2B	AVSSx	Yes

8	Internal reference, positive/ positive	Internal	Zero scale
9	External reference, positive/ positive	External	Zero scale

### $\Sigma$ - $\Delta$ ADC DIAGNOSTICS (SPI CONTROL MODE)

The AD7779  $\Sigma$ - $\Delta$  ADC diagnostic functions are accessible through the SPI interface. The internal mux placed before the PGA has different inputs, allowing the user to select a zero-scale, positive full-scale, or negative full-scale input to the  $\Sigma$ - $\Delta$  ADC, which can be converted to verify the correct operation of the  $\Sigma$ - $\Delta$  ADC channel.

The diagnostic mux control signals are shared across all the  $\Sigma$ - $\Delta$  channels. Depending on the diagnostic selected, connect the  $\Sigma$ - $\Delta$  ADC reference to a different reference source to guarantee that the conversion is within the measurable range.

There are two different ways to enable the diagnostic mux:

- Setting the CHx\_RX bit. This bit enables the input  $\Sigma$ - $\Delta$  mux. The multiplexer inputs are described in Table 32. The reference used during the conversions are controlled by the REF\_MUX\_CTRL bits.
- Setting CHx\_REF\_MONITOR. This bit has the same effect as enabling the CHx\_RX bit and selects the VDD1x/AVSSx supplies as the main reference.

If the AINx $\pm$  pin is connected to AVSSx, the input range is outside range (AVSSx + 100 mV); therefore, results may differ slightly from the expected value.

The inputs can be used alternatively to calibrate gain and offset errors.

## Σ-Δ OUTPUT DATA

### ADC CONVERSION OUTPUT—HEADER AND DATA

The AD7779 Σ-Δ conversion results are output on the DOUT0 to DOUT3 pins or over the SPI, depending on the selected interface. If the DOUTx interface is selected, the AD7779 acts as the master in the transmission. If the SPI interface is selected, the controller is the master.

The  $\overline{\text{DRDY}}$  signal indicates the end of conversion independently of the interface selected to read back the Σ-Δ conversion. When the SPI is used to read back the Σ-Δ conversion, if a new conversion is completed ( $\overline{\text{DRDY}}$  falling edge) before the previous conversion is read back, the results from previous conversion are overwritten and, consequently, the previous conversion data is corrupted.

For each channel, the width is 32 bits long: 8 bits for the header and 24 bits for the Σ-Δ conversion, as shown in Figure 106.

Figure 107. ADC Output—8-Bit Header + 24-Bit Conversion Data

In pin control mode, the header is fixed to the CRC while in SPI mode, and can be selected between CRC or error headers.

#### CRC Header

The CRC header is the header generated in pin control mode or in SPI mode if DOUT\_HEADER\_FORMAT is set.

As shown in Figure 107, the header consists of an alert bit, three bits for the ADC channel, as shown in Table 33, and four bits for the CRC.

The alert bit is set high if an error is detected in any channel, as explained in the General Errors section. The alert bit remains 1 until the error disappears.

ALERT	CHANNEL NUMBER	CHANNEL NUMBER	CHANNEL NUMBER	CRC	CRC	CRC	CRC
-------	----------------	----------------	----------------	-----	-----	-----	-----

Figure 108. CRC Header

Table 33. Channel ID

Channel	Channel ID 2	Channel ID 1	Channel ID 0
0	0	0	0
1	0	0	1
2	0	1	0
3	0	1	1
4	1	0	0
5	1	0	1
6	1	1	0
7	1	1	1

The CRC generated is eight bits long; the CRC 4 MSBs are placed on the header for the first channel in the pairing and the 4 LSBs on the header of the second channel in the pairing, as shown in Table 34. If a channel is disabled, the 24-bit output data for this channel is 0x000000.

Table 34. 8-Bit CRC, Header Configuration (Channel 2)

Channel 2 Header							
Alert	0	1	0	CRC7	CRC6	CRC5	CRC4

Table 35. 8-Bit CRC, Header Configuration (Channel 3)

Channel 3 Header							
Alert	0	1	1	CRC3	CRC2	CRC1	CRC0

#### ERROR Header (SPI Control Mode)

In SPI control mode, the default header can be replaced by an error header. If the Σ-Δ conversion is read back through the SPI interface, disable the CRC by clearing the SPI\_CRC\_TEST\_EN bit. If the DOUTx interface is used, clear the DOUT\_HEADER\_FORMAT bit.

The error header provides information of common error sources specific for each channel, as shown in Table 36. Modulator and filter errors are indicated even if the checker for this error has been specifically disabled, as described in the Σ-Δ ADC Errors section.

Table 36. Status Header Output

Bits	Name	Description
7	Alert	This bit is set high if any of the enabled diagnostic functions have detected an error, including an external clock not detected, a memory map bit flip, or an internal CRC error. This bit is not channel specific. The bit clears if the error is no longer present.
[6:4]	CH_ID_[2:0]	These bits indicate which ADC channel the following conversion data came from (see Table 33).
3	RESET_DETECTED	This bit indicates if a reset condition occurs. This bit is not channel specific.
2	MODULATOR_SATURATE	This bit indicates that the modulator output 20 consecutive 0s or 1s. The bit resets automatically after the error is no longer present.
1	FILTER_SATURATE	This bit indicates that the filter output is out of bounds. The bit resets automatically after the error is no longer present.
0	AIN_OV_UVERROR	This bit indicates that there is an AINx± overvoltage/undervoltage condition on the inputs. This bit is set until the appropriate register is read back and the error is no longer present.

## SAMPLE RATE CONVERTER (SRC) (SPI CONTROL MODE)

The AD7779 implements a patented feature called the SRC on each  $\Sigma$ - $\Delta$  channel, which allows the user to configure the output data rate or sampling frequency to any desired value, including noninteger values. The SRC achieves fine resolution control over the  $\Sigma$ - $\Delta$  ADC ODR, up to 15.2  $\mu$ SPS. In applications where the ODR must change based on changes in the input signal to maintain sampling coherency, the SRC provides fine control over the ODR. For example, to achieve the highest classification standard, Class A, in power quality applications, coherency must be maintained for 0.01 Hz changes in the input power line. The SRC can be used to achieve this sampling frequency accuracy.

In the pin control mode, the ODR is fixed per the predefined pin control options. Consequently, a noninteger number cannot be selected, as shown in Table 17.

To set the ODR, the user must program up to four registers, depending on the decimation value: two registers to program the integer value, N (the effective decimation rate), and two registers to program the decimal value, IF (the interpolation factor).

The integer value registers are SRC\_N\_MSB, Bits[3:0] and SRC\_N\_LSB, Bits[7:0]. The decimal part value registers are SRC\_IF\_MSB, Bits[7:0] and SRC\_IF\_LSB, Bits[7:0].

As an example, if an output data rate of 2.8 kHz is required, which equates to

- HR mode =  $2048/2.8 = 731.428$
- Low power mode =  $512/2.8 = 182.857$

The register values for HR mode are as follows:

- 731d = 0x2DB
- SRC\_N\_MSB[3:0] = 0x02
- SRC\_N\_LSB[7:0] = 0xDB
- $0.428d = 0.428 \times 2^{16} = 28049d = 0x6D91$
- SRC\_IF\_MSB[7:0] = 0x6D
- SRC\_IF\_LSB[7:0] = 0x91

The ODR can be updated on the fly, but a new ODR is effective in three conversion cycles of the  $\Sigma$ - $\Delta$  ADCs. This guarantees a smooth transition with no conversion results out of range.

There are two different ways to change the ODR after a new value is written in the SRC registers: via software or via hardware, depending on SRC\_UPDATE, Bit 7.

If the SRC\_LOAD\_SOURCE bit is clear, the new ODR value is updated by setting the SRC\_LOAD\_UPDATE bit to 1. This bit must be held high for at least two MCLK periods; return the bit to 0 before attempting another update.

If SRC\_LOAD\_SOURCE is set, the ODR update is controlled externally by the GPIO0 pin. Apply a pulse in the GPIO2 pin, which is then internally synchronized with the external MCLK clock, and the resultant synchronous signal is output on the GPIO1 pin.

The GPIO1 and GPIO0 pins must be externally connected.

If multiple AD7779 must be synchronized, the GPIO1 pin of one device can be connected to multiple devices. This synchronization method requires the use of a common MCLK signal for all the AD7779 devices connected, as shown in Figure 108.

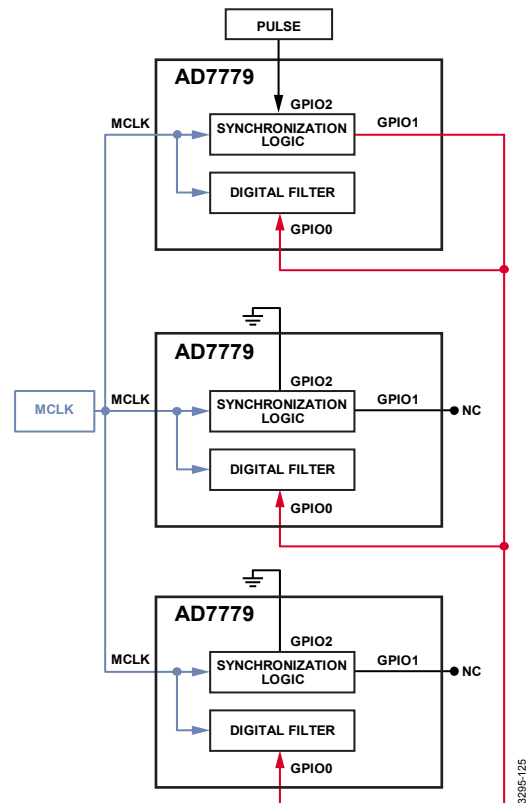

Figure 109. Hardware ODR Update

## SRC Bandwidth

The SINC filter architecture allows the user to select a noninteger value as the decimation range. This versatility means that the filter notches must be adjusted dynamically: two notches at the variable frequency, and one fixed notch to remove the PGA chopping tone. Consequently, the traditional formula for the  $-0.1$  dB and  $-3$  dB bandwidth must be adjusted depending on the selected decimation rate.

The bandwidth transfer function is not linear but can be approximated by using a linear function.

Figure 109 and Figure 110 show the correction factor for the  $-0.1$  dB and  $-3$  dB bandwidth, respectively in high resolution and low power modes. For example, when the ODR = 1000 in HR mode, the  $-0.1$  dB point is

$$BW = 0.0474 \times 1000 + 31.667 = 79.067 \text{ Hz}$$

Figure 110. -0.1 dB Correction Factor, HR Mode

Figure 111. -3 dB Correction Factor, HR Mode

Figure 112. -0.1 dB Correction Factor, LP Mode

Figure 113. -3 dB Correction Factor, LP Mode

### SRC Group Delay and Latency

The SRC group delay depends on the selected ODR and the power mode, and is defined by the following equation:

$$\text{Group delay} = \frac{PM + SRC\_N}{SRC\_N \times ODR}$$

where:

$PM$  is a value that depends on the power mode, either 64 for high resolution mode or 32 for low power mode.

$SRC\_N$  is the integer value of the programmed ODR.

$ODR$  is the programmed output data rate.

The latency is the contribution of the group delay and the calibration time.

$$\text{Latency} = \text{Group delay} + t_{CAL}$$

where  $t_{CAL} = 62 \times t_{MCLK}$ , with a maximum error of  $2 \times t_{MCLK}$ , in high resolution mode; or  $121 \times t_{MCLK}$ , with a maximum error of  $4 \times t_{MCLK}$ , in low power mode.

$t_{MCLK}$  is the modulator period,  $MCLK/4$  in high resolution mode and  $MCLK/8$  in low power mode.

### Settling Time

The settling time is defined by the contribution of all the internal stages, the filter delay, and the block calibration.

The filter delay is defined as  $3/ODR$ . In some extreme cases, as when an external pulse is applied, this value may increase to  $4/ODR$ .

## DATA OUTPUT INTERFACE

The  $\Sigma$ - $\Delta$  output data interface is defined by the CONV\_SAR, FORMAT0, and FORMAT1 pins in pin control mode at power-up. The FORMATx pins cannot be changed dynamically. Table 18 shows the available options for pin control mode. If the device is configured in SPI control mode, the SPI\_SLAVE\_MODE\_EN bit enables the SPI interface to transmit the  $\Sigma$ - $\Delta$  ADC conversion results, as shown in Table 27.

## DOUT3 to DOUT0 Data Interface

### Standalone Mode

In standalone mode, the AD7779 interface acts as a master. There are three different DOUT configurations, configurable through the FORMATx pins in pin control mode, as shown in Figure 113 through Figure 115, or via the DOUT\_FORMAT bits, Bits[7:6], in SPI control mode, as described in Table 37.

Figure 116, Figure 117, and Figure 118 show the expected data outputs for different DOUTx output modes.

Table 37. DOUTx Channels

DOUT_FORMAT Bits/ FORMATx Pins	Number of DOUTx Lines Enabled	Associated Channels
00	4	DOUT0—Channel 0 and Channel 1 DOUT1—Channel 2 and Channel 3 DOUT2—Channel 4 and Channel 5 DOUT3—Channel 6 and Channel 7
01	2	DOUT0—Channel 0, Channel 1, Channel 2, and Channel 3 DOUT1—Channel 4, Channel 5, Channel 6, and Channel 7
10	1	DOUT0—Channel 0, Channel 1, Channel 2, Channel 3, Channel 4, Channel 5, Channel 6, and Channel 7

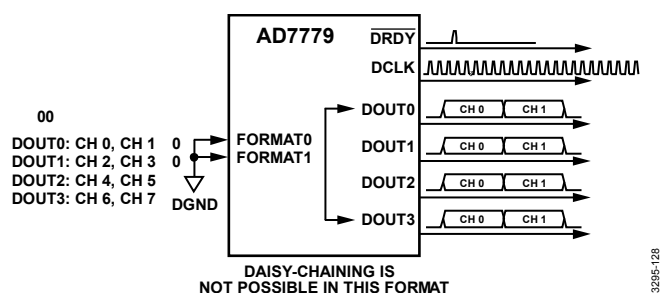

Figure 114. FORMATx Pin Configuration—FORMAT0 = 0, FORMAT1 = 0

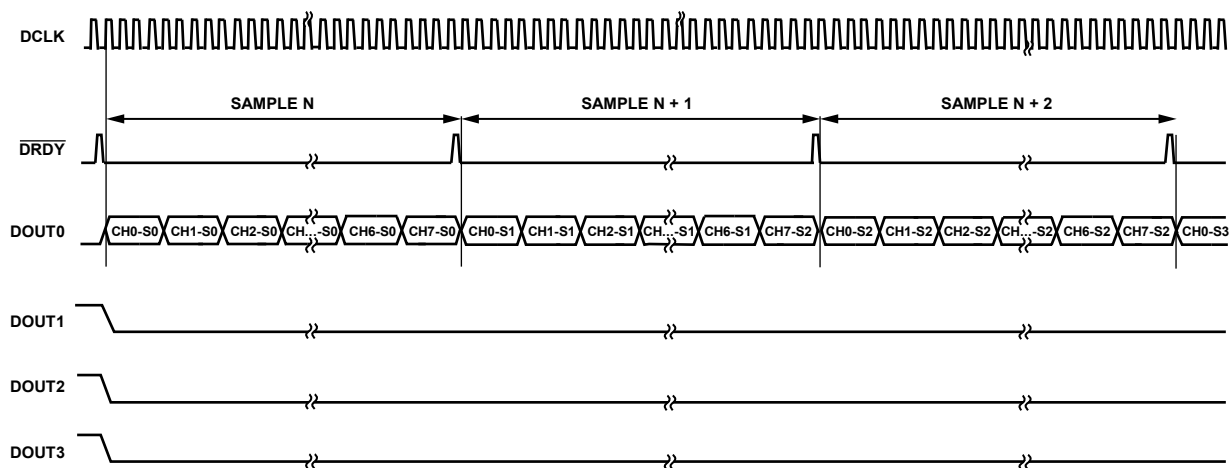

Figure 119.  $FORMAT0 = 1$ ,  $FORMAT1 = 0$ —Channel 0 to Channel 7 Output on DOUT0 Only (S0 Means Sample 0 and S1 Means Sample 1)

Daisy-Chain Mode

Daisy-chaining devices allows numerous devices to use the same data interface lines by cascading the outputs of multiple ADCs from separate AD7779 devices. In daisy-chain configuration, only one device has direct connection between the DOUTx interface and the digital host. For the AD7779, daisy-chain capability is implemented by cascading DOUT0 and DOUT1 through a number of devices, or by just using DOUT0 (this depends on the selected DOUTx mode). The ability to daisy chain devices and the limit on the number of devices that can be handled by the chain is dependent on the selected DOUTx mode and the decimation rate employed.

When operating in daisy-chain mode, it is required that all AD7779 devices in the chain are correctly synchronized. See

the Digital Reset and Synchronization Pins section for more information.

This feature is especially useful for reducing the component count and wiring connections in, for example, isolated multiconverter applications or for systems with a limited interfacing capacity.

For daisy-chain operation, there are two different configurations possible, as described in Table 38.

Using the DOUTx = 10 mode DOUT2 acts as input pins, as shown in Figure 119. In this case, the DOUT0 pin of the AD7779 devices is cascaded to the DOUT2 pin of the next device in the chain. Data readback is analogous to clocking a shift register where data is clocked on the rising edge of DCLK.

Table 38. DOUTx Modes in Daisy-Chain Operation

DOUT_FORMAT Bits/ FORMATx Pins	Number of DOUTx Lines Enabled	Associated Channels
01	2	DOUT0—Channel 0 to Channel 3 and DOUT2 DOUT1—Channel 4 to Channel 7 and DOUT3 DOUT2—input channel DOUT3—input channel
10	1	DOUT0—Channel 0 to Channel 7 and DOUT2 DOUT2—input Channel

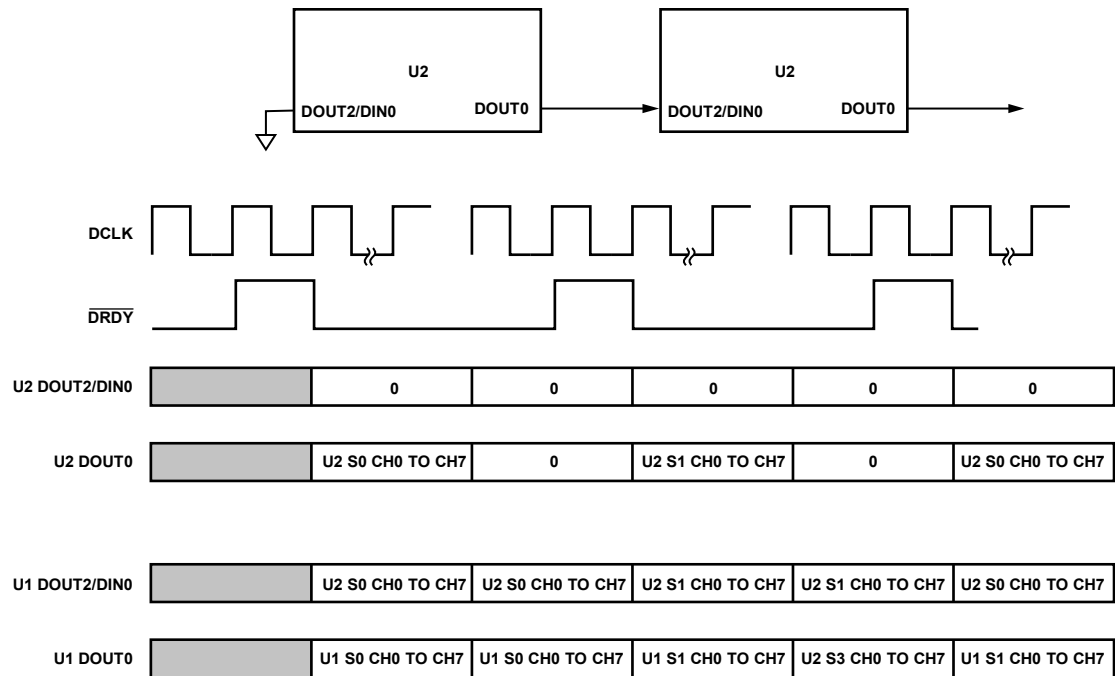

Figure 120. Daisy-Chain Connection Mode, FORMAT0 = 1, FORMAT1 = 0 (S0 Means Sample 0 and S1 Means Sample 1); When Connected in Daisy-Chain Mode, DOUT2 Acts as an Input Pin, Represented by DIN0

### Minimum DCLKx Frequency

Select the DCLKx frequency ratio in such a way that the data is completely shifted out before a new conversion is completed, otherwise the previous conversion is overwritten and the transmission becomes corrupt. The minimum DCLKx frequency ratio is defined by the decimation rate, the operation mode, and the lines enabled on the DOUT3 to DOUT0 data interface as described in the following equations:

In standalone mode,

$$\text{High Resolution Mode} - DCLK_{MIN\_RATIO} < Decimation / (8 \times CHANNELS\_PER\_DOUT)$$

$$\text{Low Power Mode} - DCLK_{MIN\_RATIO} < Decimation / (4 \times CHANNELS\_PER\_DOUT)$$

In daisy-chain mode,

$$\text{High Resolution Mode} - DCLK_{MIN\_RATIO} < Decimation / (8 \times Devices \times DOUTx\ Channels)$$

$$\text{Low Power Mode} - DCLK_{MIN\_RATIO} < Decimation / (4 \times Devices \times DOUTx\ Channels)$$

As an example, when operating in master interface mode, DOUTx = 01, the DOUT0 and DOUT1 pins shift out four  $\Sigma$ - $\Delta$  channels each and, assuming a maximum output rate in high resolution mode, the decimation = 128.

$$DCLK_{MIN} < 128 / (8 \times 4) = 4$$

If the  $DCLK_{MIN\_RATIO}$  is selected above the necessary minimum, a Logic 0 is continuously transmitted until a new sample is available.

An example in daisy-chain mode, assuming DOUTx = 01, and with three devices connected and a decimation rate of 256 in high resolution mode, is as follows:

$$DCLK_{MIN\_RATIO} < 256 / (8 \times 3 \times 4) = 2.66 = 2$$

The different ratios are summarized in Table 39.

**Table 39. Available DCLK Ratios**

DCLK_CLK_DIV (SPI Control Mode), DCLKx (Pin Control Mode)	DCLKx Ratio
000	1
001	2
010	4
011	8
100	16
101	32
110	64
111	128

There are maximum achievable ODRs and minimum DCLKx frequencies required for a given DOUTx pin configuration, as shown in Table 40 and Table 41.

**Table 40. Maximum ODRs and Minimum DCLKx Frequencies in High Resolution Mode**

Decimation Rate	ODR (kSPS)	Minimum DCLKx (kHz)		
		1 DOUTx	2 DOUTx	4 DOUTx
4095	0.500122	128	64	32
2048	1	256	128	64
1024	2	512	256	128
512	4	1024	512	256
256	8	2048	1024	512
128	16	4096	2048	1024

**Table 41. Maximum ODRs and Minimum DCLK Frequencies in Low Power Mode**

Decimation Rate	ODR (kSPS)	Minimum DCLK (kHz)		
		1 DOUT	2 DOUT	4 DOUT
2048	0.25	64	32	16
1024	0.5	128	64	32
512	1	256	128	64
256	2	512	256	128
128	4	1024	512	256
64	8	2048	1024	512

If the AD7779 operates in SPI control mode, it is possible to adjust the DOUTx strength, which can be selected in the DOUT\_DRIVE\_STR bits, as described in Table 42.

**Table 42. DOUTx Strength**

GENERAL_USER_CONFIG2, Bits[2:1]		Mode
0	0	Nominal
0	1	Strong
1	0	Weak
1	1	Extra strong

### SPI Interface

The SPI interfaces gives the user flexibility to read the conversion from the  $\Sigma$ - $\Delta$  ADC where the processor or microcontroller is the master.

When a new conversion is completed, the  $\overline{DRDY}$  signal is toggled to indicate that data can be accessed. When  $\overline{DRDY}$  toggles, the internal channel counter is reset and the next SPI read is from Channel 0 again. Conversely, after the last channel data is read, all succeeding reads before the next  $\overline{DRDY}$  signal are from Channel 7 (LSB).

Figure 121. SPI Readback, 16 Bits per Frame

Figure 122. SPI Readback, 24 Bits per Frame

The SPI operates in multiples of 8 bits per frame; Figure 120 shows a readback example in 16 bits per frames, whereas Figure 121 shows a readback in 24 bits per frame.

Note that if the device is configured in SPI control mode, the AD7779 generates a software reset if the SDI pin is sampled high for 64 consecutive clocks. To avoid a reset or unwanted register writes, it is recommended to transfer a 0x8000 command, which generates a readback command that is ignored by the device, as explained in the SPI Software Reset section.

### CALCULATING THE CRC CHECKSUM

The AD7779 implements two different CRC checksum generators, one for the  $\Sigma$ - $\Delta$  results and another for the SPI control mode.

The AD7779 uses a CRC polynomial to calculate the CRC checksum value. The 8-bit CRC polynomial used is  $x^8 + x^2 + x + 1$ .

To replicate the polynomial division in the hardware, the data is left shifted by eight bits to create a number ending in eight Logic 0s. The polynomial is aligned so that its MSB is adjacent to the leftmost Logic 1 of the data. An XOR (exclusive OR) function is applied to the data to produce a new, shorter number. The polynomial is again aligned so that its MSB is adjacent to the leftmost Logic 1 of the new result, and the procedure is repeated. This process is repeated until the original data is reduced to a value less than the polynomial. This is the 8-bit checksum.

Note that the AD7779 CRC block presets the input shift registers to 1, which means that the 8 MSBs of user data must be inverted before computing the algorithm.

As an example of CRC calculation for 16-bit data using the XOR is shown in Table 43.

Table 43. Example CRC Calculation for 16-Bit Data<sup>1, 2</sup>

Data	0	0	0	0	0	1	1	0	0	1	0	0	1	1	1	0	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

<sup>1</sup> This table represents the division of the data; blank cells are for formatting purposes.

<sup>2</sup> N/A means not applicable.

**$\Sigma$ - $\Delta$  CRC Checksum**

The CRC message is calculated internally by the AD7779 on ADC pairs. The CRC is calculated using the ADC output data from two ADCs and Bits[7:4] from the header. Therefore, 56 bits are used to calculate the 8-bit CRC. This CRC is split between the two channel headers. The CRC data covers channel pairings as follows: Channel 0 and Channel 1, Channel 2 and Channel 3, Channel 4 and Channel 5, Channel 6 and Channel 7.

The CRC is calculated from 56 bits across two consecutive/ channel pairings (Channel 0 and Channel 1, Channel 2 and Channel 3, Channel 4 and Channel 5, Channel 6 and Channel 7). The 56 bits consist of the chip error, the 3 bits for the first ADC pairing channel, and the 24 bits of data of each pairing channel.

For example, for the second channel pairing, Channel 2 and Channel 3,

$$56 \text{ bits} = \text{chip error} + 3 \text{ ADC channel bits (010)} + 24 \text{ data bits (Channel 2)} + \text{chip error} + 3 \text{ ADC channel bits (011)} + 24 \text{ data bits (Channel 3)}$$

**SPI Control Mode Checksum**

The CRC message is calculated internally by the AD7779. The data transferred to the AD7779 uses the R/W bit, a 7-bit address, and 8 bits of data for the CRC calculation.

The CRC calculated and appended to the data that it is shifted out uses the previously transmitted R/W bit, the 7-bit register address, and the 8 bits of data from the readback register.

If the SAR ADC is read back, the CRC algorithm uses the b0000 header and the 12 bits of SAR conversion data.

## REGISTER SUMMARY

Table 44. AD7779 Register Summary

Reg.	Name	Bits	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Reset	R/W

**DISABLE CLOCKS TO ADC CHANNEL REGISTER**

Address: 0x008, Reset: 0x00, Name: CH\_DISABLE

Table 53. Bit descriptions for CH\_DISABLE

Bits	Bit Name	Settings	Description	Reset	Access
7	CH7_DISABLE		Channel 7 Disable	0x0	R/W
6	CH6_DISABLE		Channel 6 Disable	0x0	R/W
5	CH5_DISABLE		Channel 5 Disable	0x0	R/W
4	CH4_DISABLE		Channel 4 Disable	0x0	R/W
3	CH3_DISABLE		Channel 3 Disable	0x0	R/W
2	CH2_DISABLE		Channel 2 Disable	0x0	R/W
1	CH1_DISABLE		Channel 1 Disable	0x0	R/W
0	CH0_DISABLE		Channel 0 Disable	0x0	R/W

**CHANNEL 0 SYNC OFFSET REGISTER**

Address: 0x009, Reset: 0x00, Name: CH0\_SYNC\_OFFSET

Table 54. Bit Descriptions for CH0\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH0_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 1 SYNC OFFSET REGISTER**

Address: 0x00A, Reset: 0x00, Name: CH1\_SYNC\_OFFSET

Table 55. Bit Descriptions for CH1\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH1_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 2 SYNC OFFSET REGISTER**

Address: 0x00B, Reset: 0x00, Name: CH2\_SYNC\_OFFSET

Table 56. Bit Descriptions for CH2\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH2_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 3 SYNC OFFSET REGISTER**

Address: 0x00C, Reset: 0x00, Name: CH3\_SYNC\_OFFSET

Table 57. Bit Descriptions for CH3\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH3_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 4 SYNC OFFSET REGISTER**

Address: 0x00D, Reset: 0x00, Name: CH4\_SYNC\_OFFSET

Table 58. Bit Descriptions for CH4\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH4_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 5 SYNC OFFSET REGISTER**

Address: 0x00E, Reset: 0x00, Name: CH5\_SYNC\_OFFSET

Table 59. Bit Descriptions for CH5\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH5_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 6 SYNC OFFSET REGISTER**

Address: 0x00F, Reset: 0x00, Name: CH6\_SYNC\_OFFSET

Table 60. Bit Descriptions for CH6\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH6_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**CHANNEL 7 SYNC OFFSET REGISTER**

Address: 0x010, Reset: 0x00, Name: CH7\_SYNC\_OFFSET

Table 61. Bit Descriptions for CH7\_SYNC\_OFFSET

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	CH7_SYNC_OFFSET		Channel Sync Offset	0x0	R/W

**GENERAL USER CONFIGURATION 1 REGISTER**

Address: 0x011, Reset: 0x24, Name: GENERAL\_USER\_CONFIG\_1

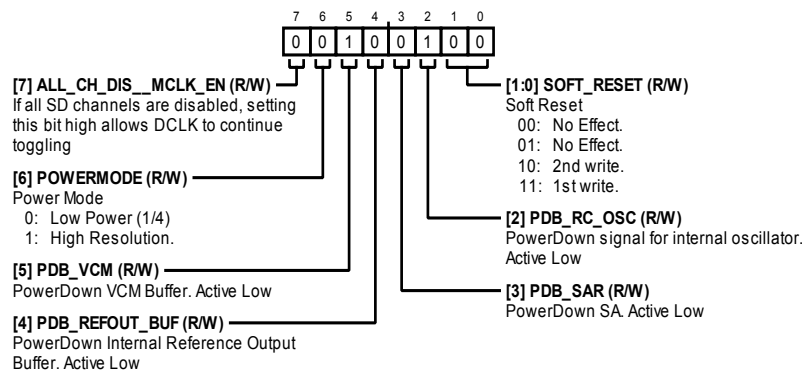

Table 62. Bit Descriptions for GENERAL\_USER\_CONFIG\_1

Bits	Bit Name	Settings	Description	Reset	Access
7	ALL_CH_DIS_MCLK_EN		If all $\Sigma$ - $\Delta$ channels are disabled, setting this bit high allows DCLK to continue toggling.	0x0	R/W
6	POWERMODE	0 1	Power Mode. Low power (1/4). High resolution.	0x0	R/W
5	PDB_VCM		Power Down VCM Buffer. Active low.	0x1	R/W
4	PDB_REFOUT_BUF		Power Down Internal Reference Output Buffer. Active low.	0x0	R/W
3	PDB_SAR		Power Down SAR. Active low.	0x0	R/W
2	PDB_RC_OSC		Power Down Signal for Internal Oscillator. Active low.	0x1	R/W

Bits	Bit Name	Settings	Description	Reset	Access
[1:0]	SOFT_RESET		Soft Reset	0x0	R/W
		00	No effect		
		01	No effect		
		10	2nd write		
		11	1st write		

## GENERAL USER CONFIGURATION 2 REGISTER

Address: 0x012, Reset: 0x09, Name: GENERAL\_USER\_CONFIG\_2

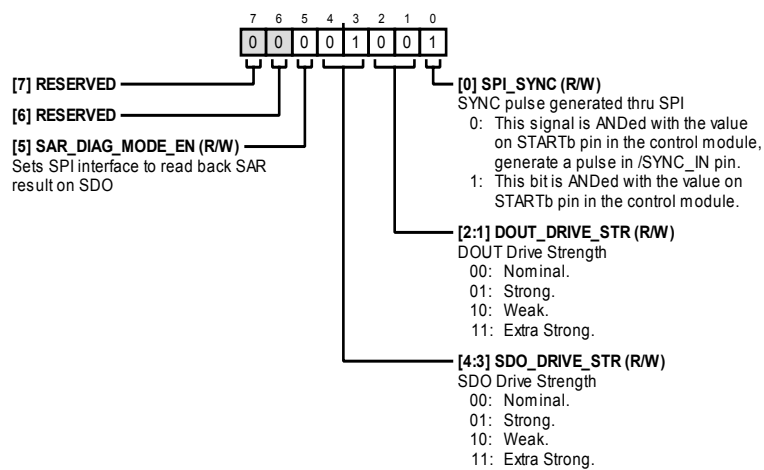

Table 63. Bit Descriptions for GENERAL\_USER\_CONFIG\_2

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	RESERVED		Reserved.	0x0	R/W
5	SAR_DIAG_MODE_EN		Sets SPI Interface to Read Back SAR Result on SDO.	0x0	R/W
[4:3]	SDO_DRIVE_STR	00 Nominal. 01 Strong. 10 Weak. 11 Extra strong.	SDO Drive Strength.	0x1	R/W
[2:1]	DOUT_DRIVE_STR	00 Nominal. 01 Strong. 10 Weak. 11 Extra strong.	DOUTx Drive Strength.	0x0	R/W
0	SPI_SYNC	0 SYNC Pulse Generated Through SPI. 0 This signal is AND'ed with the value on the $\overline{\text{START}}$ pin in the control module and generates a pulse in the $\overline{\text{SYNC\_IN}}$ pin. 1 This bit is AND'ed with the value on $\overline{\text{START}}$ pin in the control module.	SYNC Pulse Generated Through SPI.	0x1	R/W

**GENERAL USER CONFIGURATION 3 REGISTER**

Address: 0x013, Reset: 0x80, Name: GENERAL\_USER\_CONFIG\_3

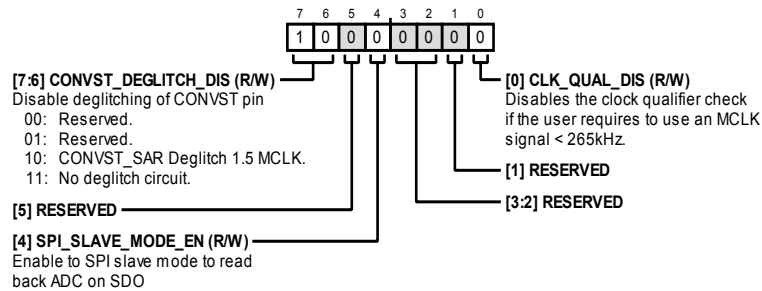

Table 64. Bit descriptions for GENERAL\_USER\_CONFIG\_3

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	CONVST_DEGLITCH_DIS	00 01 10 11	Disable deglitching of CONVST_SAR pin Reserved. Reserved. CONVST_SAR Deglitch 1.5 MCLK. No deglitch circuit.	0x2	R/W
5	RESERVED		Reserved.	0x0	R/W
4	SPI_SLAVE_MODE_EN		Enable to SPI slave mode to read back ADC on SDO	0x0	R/W
[3:2]	RESERVED		Reserved.	0x0	R/W
1	RESERVED		Reserved.	0x0	R/W
0	CLK_QUAL_DIS		Disables the clock qualifier check if the user requires to use an MCLK signal < 265 kHz.	0x0	R/W

**DATA OUTPUT FORMAT REGISTER**

Address: 0x014, Reset: 0x20, Name: DOUT\_FORMAT

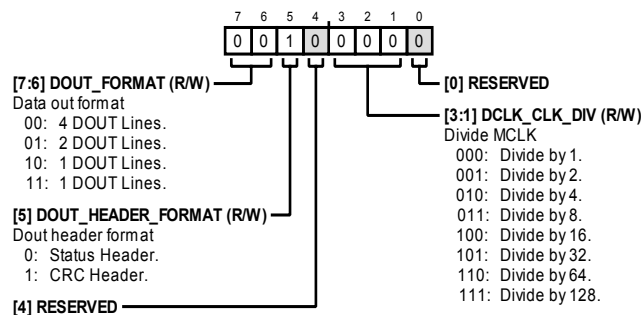

Table 65. Bit Descriptions for DOUT\_FORMAT

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	DOUT_FORMAT	00 01 10 11	Data Out Format. 4 DOUT lines 2 DOUT lines 1 DOUT lines 1 DOUT lines	0x0	R/W
5	DOUT_HEADER_FORMAT	0 1	DOUT Header Format Status header CRC header	0x1	R/W

Bits	Bit Name	Settings	Description	Reset	Access
4	RESERVED		Reserved.	0x0	R/W
[3:1]	DCLK_CLK_DIV	000 Divide by 1 001 Divide by 2 010 Divide by 4 011 Divide by 8 100 Divide by 16 101 Divide by 32 110 Divide by 64 111 Divide by 128		0x0	R/W
0	RESERVED		Reserved.	0x0	R/W

## MAIN ADC METER AND REFERENCE MUX CONTROL REGISTER

Address: 0x015, Reset: 0x00, Name: ADC\_MUX\_CONFIG

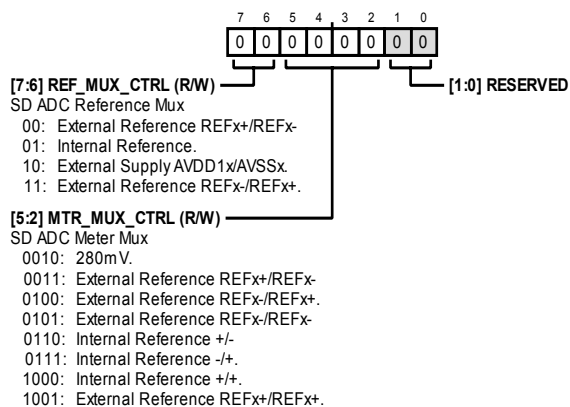

Table 66. Bit Descriptions for ADC\_MUX\_CONFIG

Bits	Bit Name	Settings	Description	Reset	Access
[7:6]	REF_MUX_CTRL	00 External reference REFx+/REFx- 01 Internal reference. 10 External supply AVDD1x/AVSSx. 11 External reference REFx-/REFx+.		0x0	R/W
[5:2]	MTR_MUX_CTRL	0010 280 mV 0011 External reference REFx+/REFx- 0100 External reference REFx-/REFx+ 0101 External reference REFx-/REFx- 0110 Internal reference +/- 0111 Internal reference -/+ 1000 Internal reference +/- 1001 External reference REFx+/REFx+		0x0	R/W
[1:0]	RESERVED		Reserved.	0x0	R/W

**GLOBAL DIAGNOSTICS MUX REGISTER**

Address: 0x016, Reset: 0x00, Name: GLOBAL\_MUX\_CONFIG

Table 67. Bit Descriptions for GLOBAL\_MUX\_CONFIG

Bits	Bit Name	Settings	Description	Reset	Access
5	CH1_ERR_MOD_SAT		Channel 1—Modulator Output Saturation Error	0x0	R
4	CH1_ERR_FILTER_SAT		Channel 1—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
3	CH1_ERR_OUTPUT_SAT		Channel 1—ADC conversion has exceeded limits and has been clamped	0x0	R
2	CH0_ERR_MOD_SAT		Channel 0—Modulator Output Saturation Error	0x0	R
1	CH0_ERR_FILTER_SAT		Channel 0—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
0	CH0_ERR_OUTPUT_SAT		Channel 0—ADC conversion has exceeded limits and has been clamped	0x0	R

**CHANNEL 2/CHANNEL 3 DSP ERRORS REGISTER**

Address: 0x055, Reset: 0x00, Name: CH2\_3\_SAT\_ERR

Table 129. Bit Descriptions for CH2\_3\_SAT\_ERR

Bits	Bit Name	Settings	Description	Reset	Access
5	CH3_ERR_MOD_SAT		Channel 3—Modulator Output Saturation Error	0x0	R
4	CH3_ERR_FILTER_SAT		Channel 3—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
3	CH3_ERR_OUTPUT_SAT		Channel 3—ADC conversion has exceeded limits and has been clamped	0x0	R
2	CH2_ERR_MOD_SAT		Channel 2—Modulator Output Saturation Error	0x0	R
1	CH2_ERR_FILTER_SAT		Channel 2—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
0	CH2_ERR_OUTPUT_SAT		Channel 2—ADC conversion has exceeded limits and has been clamped	0x0	R

**CHANNEL 4/CHANNEL 5 DSP ERRORS REGISTER**

Address: 0x056, Reset: 0x00, Name: CH4\_5\_SAT\_ERR

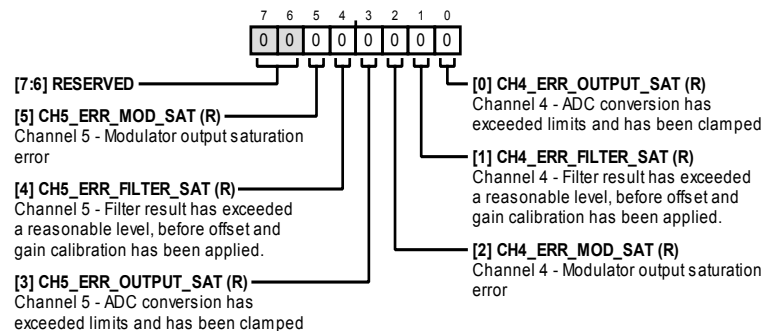

Table 130. Bit Descriptions for CH4\_5\_SAT\_ERR

Bits	Bit Name	Settings	Description	Reset	Access
5	CH5_ERR_MOD_SAT		Channel 5—Modulator Output Saturation Error	0x0	R
4	CH5_ERR_FILTER_SAT		Channel 5—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
3	CH5_ERR_OUTPUT_SAT		Channel 5—ADC conversion has exceeded limits and has been clamped	0x0	R
2	CH4_ERR_MOD_SAT		Channel 4—Modulator Output Saturation Error	0x0	R
1	CH4_ERR_FILTER_SAT		Channel 4—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
0	CH4_ERR_OUTPUT_SAT		Channel 4—ADC conversion has exceeded limits and has been clamped	0x0	R

**CHANNEL 6/CHANNEL 7 DSP ERRORS REGISTER**

Address: 0x057, Reset: 0x00, Name: CH6\_7\_SAT\_ERR

Table 131. Bit descriptions for CH6\_7\_SAT\_ERR

Bits	Bit Name	Settings	Description	Reset	Access
5	CH7_ERR_MOD_SAT		Channel 7—Modulator Output Saturation Error	0x0	R
4	CH7_ERR_FILTER_SAT		Channel 7—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
3	CH7_ERR_OUTPUT_SAT		Channel 7—ADC conversion has exceeded limits and has been clamped	0x0	R
2	CH6_ERR_MOD_SAT		Channel 6—Modulator Output Saturation Error	0x0	R
1	CH6_ERR_FILTER_SAT		Channel 6—Filter result has exceeded a reasonable level, before offset and gain calibration has been applied	0x0	R
0	CH6_ERR_OUTPUT_SAT		Channel 6—ADC conversion has exceeded limits and has been clamped	0x0	R

**CHANNEL 0 TO CHANNEL 7 ERROR REGISTER ENABLE REGISTER**

Address: 0x058, Reset: 0xFE, Name: CHX\_ERR\_REG\_EN

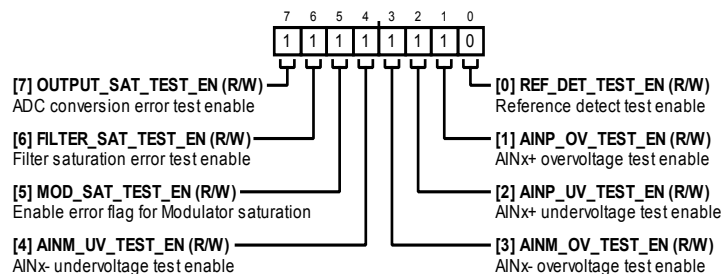

Table 132. Bit Descriptions for CHX\_ERR\_REG\_EN

Bits	Bit Name	Settings	Description	Reset	Access
7	OUTPUT_SAT_TEST_EN		ADC Conversion Error Test Enable	0x1	R/W
6	FILTER_SAT_TEST_EN		Filter Saturation Test Enable	0x1	R/W
5	MOD_SAT_TEST_EN		Enable Error Flag for Modulator Saturation	0x1	R/W
4	AINM_UV_TEST_EN		AINx- Undervoltage Test Enable	0x1	R/W
3	AINM_OV_TEST_EN		AINx- Overvoltage Test Enable	0x1	R/W
2	AINP_UV_TEST_EN		AINx+ Undervoltage Test Enable	0x1	R/W
1	AINP_OV_TEST_EN		AINx+ Overvoltage Test Enable	0x1	R/W
0	REF_DET_TEST_EN		Reference Detect Test Enable	0x0	R/W

**GENERAL ERRORS REGISTER 1**

Address: 0x059, Reset: 0x00, Name: GEN\_ERR\_REG\_1

Table 133. Bit Descriptions for GEN\_ERR\_REG\_1

Bits	Bit Name	Settings	Description	Reset	Access
5	MEMMAP_CRC_ERR		A CRC of the memory map contents is run periodically to check for errors	0x0	R
4	ROM_CRC_ERR		A CRC of the fuse contents is run periodically to check for errors in the fuses	0x0	R
3	SPI_CLK_COUNT_ERR		SPI clock counter error	0x0	R
2	SPI_INVALID_READ_ERR		SPI invalid read address	0x0	R
1	SPI_INVALID_WRITE_ERR		SPI invalid write address	0x0	R
0	SPI_CRC_ERR		SPI CRC error	0x0	R

**GENERAL ERRORS REGISTER 1 ENABLE**

Address: 0x05A, Reset: 0x3E, Name: GEN\_ERR\_REG\_1\_EN

Table 134. Bit Descriptions for GEN\_ERR\_REG\_1\_EN

Bits	Bit Name	Settings	Description	Reset	Access
5	MEMMAP_CRC_TEST_EN		Memory Map CRC Test Enable	0x1	R/W
4	ROM_CRC_TEST_EN		Fuse CRC Test Enable	0x1	R/W
3	SPI_CLK_COUNT_TEST_EN		SPI Clock Counter Test Enable	0x1	R/W
2	SPI_INVALID_READ_TEST_EN		SPI Invalid Read Address Test Enable	0x1	R/W
1	SPI_INVALID_WRITE_TEST_EN		SPI Invalid Write Address Test Enable	0x1	R/W
0	SPI_CRC_TEST_EN		SPI CRC Error Test Enable	0x0	R/W

**GENERAL ERRORS REGISTER 2**

Address: 0x05B, Reset: 0x00, Name: GEN\_ERR\_REG\_2

Table 135. Bit Descriptions for GEN\_ERR\_REG\_2

Bits	Bit Name	Settings	Description	Reset	Access
5	RESET_DETECTED		Reset Detected	0x0	R
4	EXT_MCLK_SWITCH_ERR		Clock Not Switched Over	0x0	R
2	ALDO1_PSM_ERR		AREG1CAP Power Supply Error	0x0	R
1	ALDO2_PSM_ERR		AREG2CAP Power Supply Error	0x0	R
0	DLDO_PSM_ERR		DREGCAP Power Supply Error	0x0	R

**GENERAL ERRORS REGISTER 2 ENABLE**

Address: 0x05C, Reset: 0x3C, Name: GEN\_ERR\_REG\_2\_EN

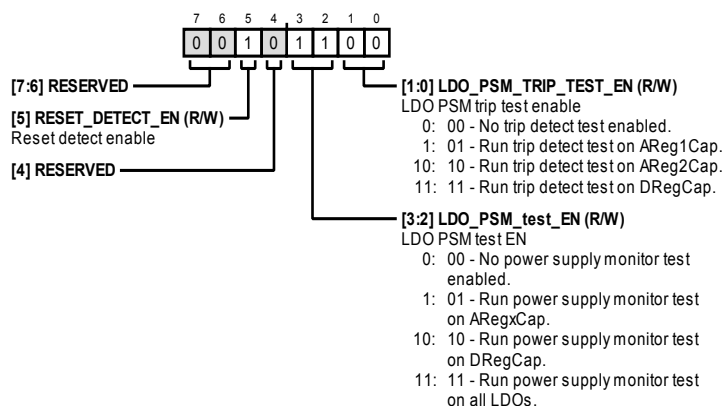

Table 136. Bit Descriptions for GEN\_ERR\_REG\_2\_EN

Bits	Bit Name	Settings	Description	Reset	Access
5	RESET_DETECT_EN		Reset Detect Enable	0x1	R/W
4	RESERVED		Reserved	0x1	R/W
[3:2]	LDO_PSM_TEST_EN		LDO PSM Test EN	0x3	R/W
		0	00—no power supply monitor test enabled.		
		1	01—run power supply monitor test on AREGxCAP		
		10	10—run power supply monitor test on DREGCAP		
		11	11—run power supply monitor test on all LDOs		
[1:0]	LDO_PSM_TRIP_TEST_EN		LDO PSM Trip Test Enable	0x0	R/W
		0	00—no trip detect test enabled		
		1	01—run trip detect test on AREG1CAP		
		10	10—run trip detect test on AREG2CAP		
		11	11—run trip detect test on DREGCAP		

**ERROR STATUS REGISTER 1**

Address: 0x05D, Reset: 0x00, Name: STATUS\_REG\_1

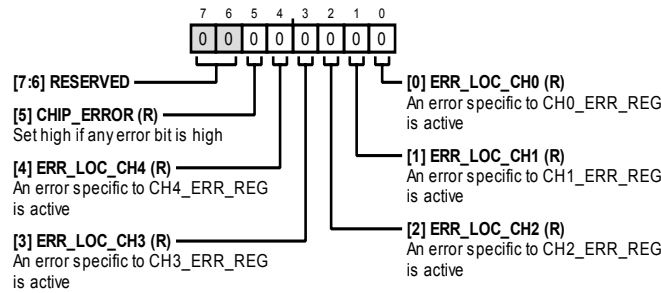

Table 137. Bit Descriptions for STATUS\_REG\_1

Bits	Bit Name	Settings	Description	Reset	Access
5	CHIP_ERROR		Set this bit high if any error bit is high	0x0	R
4	ERR_LOC_CH4		An error specific to CH4_ERR_REG is active	0x0	R
3	ERR_LOC_CH3		An error specific to CH3_ERR_REG is active	0x0	R
2	ERR_LOC_CH2		An error specific to CH2_ERR_REG is active	0x0	R
1	ERR_LOC_CH1		An error specific to CH1_ERR_REG is active	0x0	R
0	ERR_LOC_CH0		An error specific to CH0_ERR_REG is active	0x0	R

**ERROR STATUS REGISTER 2**

Address: 0x05E, Reset: 0x00, Name: STATUS\_REG\_2

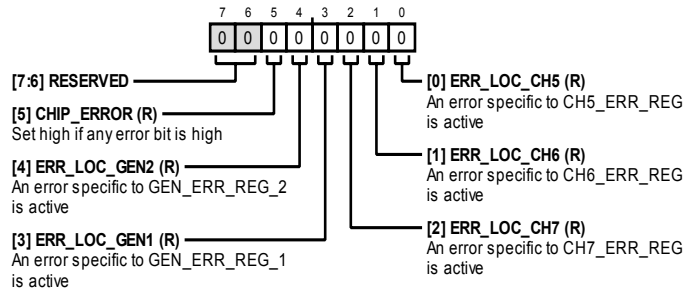

Table 138. Bit Descriptions for STATUS\_REG\_2

Bits	Bit Name	Settings	Description	Reset	Access
5	CHIP_ERROR		Set high if any error bit is high	0x0	R
4	ERR_LOC_GEN2		An error specific to GEN_ERR_REG_2 is active	0x0	R
3	ERR_LOC_GEN1		An error specific to GEN_ERR_REG_1 is active	0x0	R
2	ERR_LOC_CH7		An error specific to CH7_ERR_REG is active	0x0	R
1	ERR_LOC_CH6		An error specific to CH6_ERR_REG is active	0x0	R
0	ERR_LOC_CH5		An error specific to CH5_ERR_REG is active	0x0	R

**ERROR STATUS REGISTER 3**

Address: 0x05F, Reset: 0x00, Name: STATUS\_REG\_3

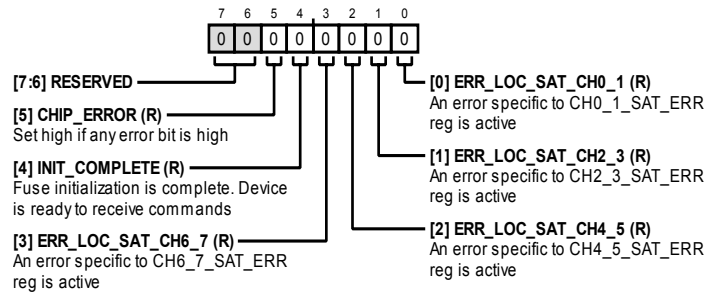

Table 139. Bit Descriptions for STATUS\_REG\_3

Bits	Bit Name	Settings	Description	Reset	Access
5	CHIP_ERROR		Set high if any error bit is high.	0x0	R
4	INIT_COMPLETE		Fuse initialization is complete. Device is ready to receive commands.	0x0	R
3	ERR_LOC_SAT_CH6_7		An error specific to CH6_7_SAT_ERR register is active.	0x0	R
2	ERR_LOC_SAT_CH4_5		An error specific to CH4_5_SAT_ERR register is active.	0x0	R
1	ERR_LOC_SAT_CH2_3		An error specific to CH2_3_SAT_ERR register is active.	0x0	R
0	ERR_LOC_SAT_CH0_1		An error specific to CH0_1_SAT_ERR register is active.	0x0	R

**DECIMATION RATE (N) MSB REGISTER**

Address: 0x060, Reset: 0x00, Name: SRC\_N\_MSB

Table 140. Bit Descriptions for SRC\_N\_MSB

Bits	Bit Name	Settings	Description	Reset	Access
[3:0]	SRC_N_ALL[11:8]		SRC N Combined	0x0	R/W

**DECIMATION RATE (N) LSB REGISTER**

Address: 0x061, Reset: 0x80, Name: SRC\_N\_LSB

Table 141. Bit Descriptions for SRC\_N\_LSB

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	SRC_N_ALL[7:0]		SRC N Combined	0x0	R/W

**DECIMATION RATE (IF) MSB REGISTER**

Address: 0x062, Reset: 0x00, Name: SRC\_IF\_MSB

Table 142. Bit Descriptions for SRC\_IF\_MSB

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	SRC_IF_ALL[15:8]		SRC IF All	0x0	R/W

**DECIMATION RATE (IF) LSB REGISTER**

Address: 0x063, Reset: 0x00, Name: SRC\_IF\_LSB

Table 143. Bit Descriptions for SRC\_IF\_LSB

Bits	Bit Name	Settings	Description	Reset	Access
[7:0]	SRC_IF_ALL[7:0]		SRC IF All	0x0	R/W

**SRC LOAD SOURCE AND LOAD UPDATE REGISTER**

Address: 0x064, Reset: 0x00, Name: SRC\_UPDATE

Table 144. Bit Descriptions for SRC\_UPDATE

Bits	Bit Name	Settings	Description	Reset	Access
7	SRC_LOAD_SOURCE		Selects which option to load an SRC update	0x0	R/W
0	SRC_LOAD_UPDATE		Asserts bit to load SRC registers into SRC	0x0	R/W

## OUTLINE DIMENSIONS

Figure 123. 64-Lead Lead Frame Chip Scale Package [LFCSP]  
9 mm × 9 mm Body and 0.75 mm Package Height  
(CP-64-15)  
Dimensions shown in millimeters

## ORDERING GUIDE

Model <sup>1</sup>	Temperature Range	Package Description	Package Option
AD7779ACPZ	−40°C to +125°C	64-Lead Lead Frame Chip Scale Package [LFCSP]	CP-64-15
AD7779ACPZ-RL	−40°C to +125°C	64-Lead Lead Frame Chip Scale Package [LFCSP]	CP-64-15
EVAL-AD7779FMCZ		Evaluation Board	
EVAL-SDP-CH1Z		SDP Controller Board	

<sup>1</sup> Z = RoHS Compliant Part.
